SOLUBILITY OF SELECTED GASES IN WATER

L. H. Gevantman

The values in this table are taken almost exclusively from the International Union of Pure and Applied Chemistry "Solubility Data Series." Unless noted, they comprise evaluated data fitted to a smoothing equation. The data at each temperature are then derived from the smoothing equation which expresses the mole fraction solubility X_1 of the gas in solution as:

$$\ln X_1 = A + B/T^* + C \ln T^*$$

where

$$T^* = T/100\ \text{K}$$

All values refer to a partial pressure of the gas of 101.325 kPa (one atmosphere).

The equation constants, the standard deviation for $\ln X_1$ (except where noted), and the temperature range over which the equation applies are given in the column headed Equation constants. There are two exceptions. The equation for methane has an added term, DT^*. The equation for H_2Se and H_2S takes the form,

$$\ln X_1 = A + B/T + C \ln T + DT$$

where T is the temperature in kelvin.

Solubilities given for those gases that react with water, namely ozone, nitrogen oxides, chlorine and its oxides, carbon dioxide, hydrogen sulfide, hydrogen selenide and sulfur dioxide, are recorded as bulk solubilities; i.e., all chemical species of the gas and its reaction products with water are included.

T/K	Solubility (X_1)	Equation constants	Ref.
Hydrogen (H_2) M_r = 2.01588

SOLUBILITY OF CARBON DIOXIDE IN WATER AT VARIOUS TEMPERATURES AND PRESSURES

The solubility of CO_2 in water, expressed as mole fraction of CO_2 in the liquid phase, is given for pressures up to atmospheric and temperatures of 0 to 100 °C. Note that 1 standard atmosphere equals 101.325 kPa. The references give data over a wider range of temperature and pressure. The estimated uncertainty is about 2%.

AQUEOUS SOLUBILITY AND HENRY'S LAW CONSTANTS OF ORGANIC COMPOUNDS

The solubility in water of about 1300 organic compounds, including many compounds of environmental interest, is tabulated here. When data are available, values are given at several temperatures between 0 °C and 100 °C. Solids, liquids, and gases are included; additional data on gases can be found in the table "Solubility of Selected Gases in Water" in Section 5.

Solubility of solids is defined as the concentration of the compound in a solution that is in equilibrium with the solid phase at the specified temperature and one atmosphere pressure. For liquids whose water mixtures separate into two phases, the solubility given here is the concentration of the specified compound in the water-rich phase at equilibrium. In the case of gases (i.e., compounds whose vapor pressure at the specified temperature exceeds one atmosphere) the solubility is defined here as the concentration in the water phase when the partial pressure of the compound above the solution is 101.325 kPa (1 atm). Values for gases are marked with an asterisk.

The solubility values in this table are expressed as mass percent of solute, $s = 100w_2$, where the mass fraction w_2 is defined as

$$w_2 = m_2/(m_1 + m_2)$$

where m_2 is the mass of solute and m_1 the mass of water. For convenience, the solubility expressed in grams of solute that will dissolve in 1 kilogram of water is tabulated in the adjacent column to mass percent. For compounds with low solubility (e.g., $s < 1\%$), that column is, to a high approximation, numerically identical to the solubility expressed in grams of solute per liter of solution.

The mass fraction w_2 is related to other common measures of solubility as follows:

Molality: $m_2 = 1000\ w_2/M_2(1 - w_2)$
Molarity: $c_2 = 1000\rho w_2/M_2$
Mole fraction: $x_2 = (w_2/M_2)/\{(w_2/M_2) + (1 - w_2)/M_1\}$
Mass of solute per 100 g of H_2O: $100w_2/(1 - w_2)$
Mass of solute per liter of solution: $1000\rho w_2$

Here, M_2 is the molar mass of the solute, $M_1 = 18.015$ g/mol is the molar mass of water, and ρ is the density of the solution in g/mL.

Data have been selected from evaluated sources wherever possible, in particular the *IUPAC Solubility Data Series*. Many values come from experimental measurements reported in the *Journal of Chemical and Engineering Data* and the *Journal of Chemical Thermodynamics*, as well as critical review papers in the *Journal of Physical and Chemical Reference Data*. The primary source for each value is listed in the column following the solubility values; additional references of interest are sometimes given. Many of the references contain solubility data at other temperatures and pH values and in the presence of other compounds. The user is cautioned that wide variations of data are found in the literature for the lower solubility compounds. The references should be consulted for more information on these compounds.

The table also contains values of the Henry's Law constant k_H, which provides a measure of the partition of a substance between the atmosphere and the aqueous phase. Here, k_H is defined as the limit of p_2/c_2 as the concentration approaches zero, where p_2 is the partial pressure of the solute above the solution and c_2 is the concentration in the solution at equilibrium (other formulations of Henry's Law are often used; see Reference 5). The values of k_H listed here are based on direct experimental measurement whenever available, but many of them are simply calculated as the ratio of the pure compound vapor pressure to the solubility. This approximation is reliable only for compounds of very low solubility. In fact, values of k_H found in the literature frequently differ by a factor of two or three, and variations over an order of magnitude are not unusual (Reference 5). Therefore, the data given here should be taken only as a rough indication of the true Henry's Law constant, which is difficult to measure precisely.

All values of k_H refer to 25 °C. If the vapor pressure of the compound at 25 °C is greater than one atmosphere, it can be assumed that the k_H value has been calculated as $101.325/c_2$. The source of the Henry's Law data is given in the last column. The air-water partition coefficient (i.e., ratio of air concentration to water concentration when both are expressed in the same units) is equal to k_H/RT or $k_H/2.48$ in the units used here.

Compounds are listed by systematic name.

* Indicates a value of s for a gas at a partial pressure of 101.325 kPa (1 atm) in equilibrium with the solution.

AQUEOUS SOLUBILITY OF INORGANIC COMPOUNDS AT VARIOUS TEMPERATURES

The solubility of over 300 common inorganic compounds in water is tabulated here as a function of temperature. Solubility is defined as the concentration of the compound in a solution that is in equilibrium with a solid phase at the specified temperature. In this table the solid phase is generally the most stable crystalline phase at the temperature in question. An asterisk * on solubility values in adjacent columns indicates that the solid phase changes between those two temperatures (usually from one hydrated phase to another or from a hydrate to the anhydrous solid). In such cases the slope of the solubility vs. temperature curve may show a discontinuity.

All solubility values are expressed as mass percent of solute, $100 \times w_2$, where

$$w_2 = m_2/(m_1 + m_2)$$

and m_2 is the mass of solute and m_1 the mass of water. This quantity is related to other common measures of solubility as follows:

Molarity: $c_2 = 1000\rho w_2/M_2$
Molality: $m_2 = 1000w_2/M_2(1\text{-}w_2)$
Mole fraction: $x_2 = (w_2/M_2)/\{(w_2/M_2) + (1\text{-}w_2)/M_1\}$
Mass of solute per 100 g of H_2O: $r_2 = 100w_2/(1\text{-}w_2)$

Here M_2 is the molar mass of the solute and M_1 = 18.015 g/mol is the molar mass of water; ρ is the density of the solution in g cm^{-3}.

The data in the table have been derived from the references indicated; in many cases the data have been refitted or interpolated in order to present solubility at rounded values of temperature. Where available, values were taken from the IUPAC *Solubility Data Series* (Reference 1) or related papers in the *Journal of Physical and Chemical Reference Data* (References 2 to 5), which present carefully evaluated data.

The solubility of sparingly soluble compounds that do not appear in this table may be calculated from the data in the table "Solubility Product Constants." Solubility of inorganic gases may be found in the table "Solubility of Selected Gases in Water."

Compounds are listed alphabetically by formula.

* Solid phase changes between these temperatures

OCTANOL-WATER PARTITION COEFFICIENTS

The octanol–water partition coefficient, *P*, is a widely used parameter for correlating biological effects of organic substances. It is a property of the two-phase system in which water and 1-octanol are in equilibrium at a fixed temperature and the substance is distributed between the water-rich and octanol-rich phases. *P* is defined as the ratio of the equilibrium concentration of the substance in the octanol-rich phase to that in the water-rich phase, in the limit of zero concentration. In general, *P* tends to be large for compounds with extended non-polar structures (such as long chain or multi-ring hydrocarbons) and small for compounds with highly polar groups. Thus *P* (or, in its more common form of expression, log *P*) provides a measure of the lipophilic vs. hydrophilic nature of a compound, which is an important consideration in assessing the potential toxicity. A discussion of methods of measurement and accuracy considerations for log *P* may be found in Reference 1.

This table gives selected values of log *P* for about 450 organic compounds, including many of environmental importance. All values refer to a nominal temperature of 25 °C. The source of each value is indicated in the last column. These references contain data on many more compounds than are included here.

Compounds are listed by systematic name.

SOLUBILITY PRODUCT CONSTANTS

The solubility product constant K_{sp} is a useful parameter for calculating the aqueous solubility of sparingly soluble compounds under various conditions. It may be determined by direct measurement or calculated from the standard Gibbs energies of formation $\Delta_f G°$ of the species involved at their standard states. Thus if $K_{sp} = [M^+]^m \cdot [A^-]^n$ is the equilibrium constant for the reaction

$$M_mA_n(s) \rightleftharpoons mM^+(aq) + nA^-(aq),$$

where M_mA_n is the slightly soluble substance and M^+ and A^- are the ions produced in solution by the dissociation of M_mA_n, then the Gibbs energy change is

$$\Delta G° = m\,\Delta_f G°\,(M^+,aq) + n\,\Delta_f G°\,(A^-,aq) - \Delta_f G°\,(M_mA_n, s)$$

The solubility product constant is calculated from the equation

$$\ln K_{sp} = -\Delta G°/RT$$

The table gives selected values of K_{sp} at 25 °C. Many of these have been calculated from standard state thermodynamic data in References 1 and 2; other values are taken from publications of the IUPAC Solubility Data Project (References 3 to 7).

The above formulation is not convenient for treating sulfides because the S^{-2} ion is usually not present in significant concentrations (see Reference 8). This is due to the hydrolysis reaction

$$S^{-2} + H_2O \rightleftharpoons HS^- + OH^-$$

which is strongly shifted to the right except in very basic solutions. Furthermore, the equilibrium constant for this reaction, which depends on the second ionization constant of H_2S, is poorly known. Therefore it is more useful in the case of sulfides to define a different solubility product K_{spa} based on the reaction

$$M_mS_n(s) + 2H^+ \rightleftharpoons mM^+ + nH_2S\,(aq)$$

Values of K_{spa} taken from Reference 8 are given for several sulfides in the last column. Additional discussion of sulfide equilibria may be found in References 7 and 9.

Name	Formula	K_{sp}	K_{spa}
Aluminum phosphate	$AlPO_4$	$9.84\cdot10^{-21}$	
Barium bromate	$Ba(BrO_3)_2$	$2.43\cdot10^{-4}$	
Barium carbonate	$BaCO_3$	$2.58\cdot10^{-9}$	
Barium chromate(VI)	$BaCrO_4$	$1.17\cdot10^{-10}$	
Barium fluoride	BaF_2	$1.84\cdot10^{-7}$	
Barium hydroxide octahydrate	$Ba(OH)_2\cdot8H_2O$	$2.55\cdot10^{-4}$	
Barium iodate	$Ba(IO_3)_2$	$4.01\cdot10^{-9}$	
Barium iodate monohydrate	$Ba(IO_3)_2\cdot H_2O$	$1.67\cdot10^{-9}$	
Barium molybdate	$BaMoO_4$	$3.54\cdot10^{-8}$	
Barium selenate	$BaSeO_4$	$3.40\cdot10^{-8}$	
Barium sulfate	$BaSO_4$	$1.08\cdot10^{-10}$	
Barium sulfite	$BaSO_3$	$5.0\cdot10^{-10}$	
Beryllium hydroxide (α)	$Be(OH)_2$	$6.92\cdot10^{-22}$	
Bismuth arsenate	$BiAsO_4$	$4.43\cdot10^{-10}$	
Bismuth triiodide	BiI_3	$7.71\cdot10^{-19}$	
Cadmium arsenate	$Cd_3(AsO_4)_2$	$2.2\cdot10^{-33}$	
Cadmium carbonate	$CdCO_3$	$1.0\cdot10^{-12}$	
Cadmium fluoride	CdF_2	$6.44\cdot10^{-3}$	
Cadmium hydroxide	$Cd(OH)_2$	$7.2\cdot10^{-15}$	
Cadmium iodate	$Cd(IO_3)_2$	$2.5\cdot10^{-8}$	
Cadmium oxalate trihydrate	$CdC_2O_4\cdot3H_2O$	$1.42\cdot10^{-8}$	
Cadmium phosphate	$Cd_3(PO_4)_2$	$2.53\cdot10^{-33}$	
Cadmium sulfide	CdS		$8\cdot10^{-7}$
Calcium carbonate (calcite)	$CaCO_3$	$3.36\cdot10^{-9}$	
Calcium fluoride	CaF_2	$3.45\cdot10^{-11}$	
Calcium hydroxide	$Ca(OH)_2$	$5.02\cdot10^{-6}$	
Calcium iodate	$Ca(IO_3)_2$	$6.47\cdot10^{-6}$	
Calcium iodate hexahydrate	$Ca(IO_3)_2\cdot6H_2O$	$7.10\cdot10^{-7}$	
Calcium molybdate	$CaMoO_4$	$1.46\cdot10^{-8}$	
Calcium oxalate monohydrate	$CaC_2O_4\cdot H_2O$	$2.32\cdot10^{-9}$	
Calcium phosphate	$Ca_3(PO_4)_2$	$2.07\cdot10^{-33}$	
Calcium sulfate	$CaSO_4$	$4.93\cdot10^{-5}$	
Calcium sulfate dihydrate	$CaSO_4\cdot2H_2O$	$3.14\cdot10^{-5}$	
Calcium sulfite hemihydrate	$CaSO_3\cdot0.5H_2O$	$3.1\cdot10^{-7}$	
Cesium perchlorate	$CsClO_4$	$3.95\cdot10^{-3}$	
Cesium periodate	$CsIO_4$	$5.16\cdot10^{-6}$	
Cobalt(II) arsenate	$Co_3(AsO_4)_2$	$6.80\cdot10^{-29}$	
Cobalt(II) hydroxide	$Co(OH)_2$	$5.92\cdot10^{-15}$	
Cobalt(II) iodate dihydrate	$Co(IO_3)_2\cdot2H_2O$	$1.21\cdot10^{-2}$	
Cobalt(II) phosphate	$Co_3(PO_4)_2$	$2.05\cdot10^{-35}$	
Copper(II) arsenate	$Cu_3(AsO_4)_2$	$7.95\cdot10^{-36}$	
Copper(I) bromide	CuBr	$6.27\cdot10^{-9}$	
Copper(I) chloride	CuCl	$1.72\cdot10^{-7}$	
Copper(I) cyanide	CuCN	$3.47\cdot10^{-20}$	
Copper(II) iodate monohydrate	$Cu(IO_3)_2\cdot H_2O$	$6.94\cdot10^{-8}$	
Copper(I) iodide	CuI	$1.27\cdot10^{-12}$	
Copper(II) oxalate	CuC_2O_4	$4.43\cdot10^{-10}$	
Copper(II) phosphate	$Cu_3(PO_4)_2$	$1.40\cdot10^{-37}$	
Copper(II) sulfide	CuS		$6\cdot10^{-16}$
Copper(I) thiocyanate	CuSCN	$1.77\cdot10^{-13}$	
Europium(III) hydroxide	$Eu(OH)_3$	$9.38\cdot10^{-27}$	
Gallium(III) hydroxide	$Ga(OH)_3$	$7.28\cdot10^{-36}$	
Iron(II) carbonate	$FeCO_3$	$3.13\cdot10^{-11}$	
Iron(II) fluoride	FeF_2	$2.36\cdot10^{-6}$	
Iron(II) hydroxide	$Fe(OH)_2$	$4.87\cdot10^{-17}$	
Iron(III) hydroxide	$Fe(OH)_3$	$2.79\cdot10^{-39}$	

Name	Formula	K_{sp}	K_{spa}
Iron(III) phosphate dihydrate	$FePO_4 \cdot 2H_2O$	$9.91 \cdot 10^{-16}$	
Iron(II) sulfide	FeS		$6 \cdot 10^{2}$
Lanthanum iodate	$La(IO_3)_3$	$7.50 \cdot 10^{-12}$	
Lead(II) bromide	$PbBr_2$	$6.60 \cdot 10^{-6}$	
Lead(II) carbonate	$PbCO_3$	$7.40 \cdot 10^{-14}$

Praseodymium(III) hydroxide	$Pr(OH)_3$	$3.39 \cdot 10^{-24}$	
Radium iodate	$Ra(IO_3)_2$	$1.16 \cdot 10^{-9}$	
Radium sulfate	$RaSO_4$	$3.66 \cdot 10^{-11}$	
Rubidium perchlorate	$RbClO_4$	$3.00 \cdot 10^{-3}$	
Scandium fluoride	ScF_3	$5.81 \cdot 10^{-24}$	
Scandium hydroxide	$Sc(OH)_3$	$2.22 \cdot 10^{-31}$	
Silver(I) acetate	$AgC_2H_3O_2$	$1.94 \cdot 10^{-3}$	
Silver(I) arsenate	Ag_3AsO_4	$1.03 \cdot 10^{-22}$	
Silver(I) bromate	$AgBrO_3$	$5.38 \cdot 10^{-5}$	
Silver(I) bromide	AgBr	$5.35 \cdot 10^{-13}$	
Silver(I) carbonate	Ag_2CO_3	$8.46 \cdot 10^{-12}$	
Silver(I) chloride	AgCl	$1.77 \cdot 10^{-10}$	
Silver(I) chromate	Ag_2CrO_4	$1.12 \cdot 10^{-12}$	
Silver(I) cyanide	AgCN	$5.97 \cdot 10^{-17}$	
Silver(I) iodate	$AgIO_3$	$3.17 \cdot 10^{-8}$	
Silver(I) iodide	AgI	$8.52 \cdot 10^{-17}$	
Silver(I) oxalate	$Ag_2C_2O_4$	$5.40 \cdot 10^{-12}$	
Silver(I) phosphate	Ag_3PO_4	$8.89 \cdot 10^{-17}$	
Silver(I) sulfate	Ag_2SO_4	$1.20 \cdot 10^{-5}$	
Silver(I) sulfide	Ag_2S		$6 \cdot 10^{-30}$
Silver(I) sulfite	Ag_2SO_3	$1.50 \cdot 10^{-14}$	
Silver(I) thiocyanate	AgSCN	$1.03 \cdot 10^{-12}$	
Strontium arsenate	$Sr_3(AsO_4)_2$	$4.29 \cdot 10^{-19}$	
Strontium carbonate	$SrCO_3$	$5.60 \cdot 10^{-10}$	
Strontium fluoride	SrF_2	$4.33 \cdot 10^{-9}$	
Strontium iodate	$Sr(IO_3)_2$	$1.14 \cdot 10^{-7}$	
Strontium iodate hexahydrate	$Sr(IO_3)_2 \cdot 6H_2O$	$4.55 \cdot 10^{-7}$	
Strontium iodate monohydrate	$Sr(IO_3)_2 \cdot H_2O$	$3.77 \cdot 10^{-7}$	
Strontium sulfate	$SrSO_4$	$3.44 \cdot 10^{-7}$	
Thallium(I) bromate	$TlBrO_3$	$1.10 \cdot 10^{-4}$	
Thallium(I) bromide	TlBr	$3.71 \cdot 10^{-6}$	
Thallium(I) chloride	TlCl	$1.86 \cdot 10^{-4}$	
Thallium(I) chromate	Tl_2CrO_4	$8.67 \cdot 10^{-13}$	
Thallium(III) hydroxide	$Tl(OH)_3$	$1.68 \cdot 10^{-44}$	
Thallium(I) iodate	$TlIO_3$	$3.12 \cdot 10^{-6}$	
Thallium(I) iodide	TlI	$5.54 \cdot 10^{-8}$	
Thallium(I) thiocyanate	TlSCN	$1.57 \cdot 10^{-4}$	
Tin(II) hydroxide	$Sn(OH)_2$	$5.45 \cdot 10^{-27}$	
Tin(II) sulfide	SnS		$1 \cdot 10^{-5}$
Yttrium carbonate	$Y_2(CO_3)_3$	$1.03 \cdot 10^{-31}$	
Yttrium fluoride	YF_3	$8.62 \cdot 10^{-21}$	
Yttrium hydroxide	$Y(OH)_3$	$1.00 \cdot 10^{-22}$	
Yttrium iodate	$Y(IO_3)_3$	$1.12 \cdot 10^{-10}$	
Zinc arsenate	$Zn_3(AsO_4)_2$	$2.8 \cdot 10^{-28}$	
Zinc carbonate	$ZnCO_3$	$1.46 \cdot 10^{-10}$	
Zinc carbonate monohydrate	$ZnCO_3 \cdot H_2O$	$5.42 \cdot 10^{-11}$	
Zinc fluoride	ZnF_2	$3.04 \cdot 10^{-2}$	
Zinc hydroxide	$Zn(OH)_2$	$3 \cdot 10^{-17}$	
Zinc iodate dihydrate	$Zn(IO_3)_2 \cdot 2H_2O$	$4.1 \cdot 10^{-6}$	
Zinc oxalate dihydrate	$ZnC_2O_4 \cdot 2H_2O$	$1.38 \cdot 10^{-9}$	
Zinc selenide	ZnSe	$3.6 \cdot 10^{-26}$	
Zinc selenite monohydrate	$ZnSeO_3 \cdot H_2O$	$1.59 \cdot 10^{-7}$	
Zinc sulfide (sphalerite)	ZnS		$2 \cdot 10^{-4}$
Zinc sulfide (wurtzite)	ZnS		$3 \cdot 10^{-2}$

SOLUBILITY OF COMMON SALTS AT AMBIENT TEMPERATURES

This table gives the aqueous solubility of selected salts at temperatures from 10 °C to 40 °C. Values are given in molality terms.

SOLUBILITY OF HYDROCARBONS IN SEAWATER

Concern about pollution of the oceans has stimulated measurements of the solubility of organic compounds in seawater. This table gives the solubility of several hydrocarbons in seawater. The data are derived from a review in the IUPAC Solubility Data Series (Reference 1).

Solubility is expressed in this table as parts per million by mass, i.e.,

$$S/\text{ppm(mass)} = 10^6 \times w_2 = 10^6 \times m_2/(m_1 + m_2)$$

where m_1 and m_2 are the masses of solvent (seawater) and solute, respectively, under saturation conditions, and w_2 is the mass fraction. Since the solubilities in this table are very low, the value of S is effectively the mass of hydrocarbon in grams per 1000 kg of seawater.

The temperature and salinity of each measurement are given in the table. Salinity is a standardized measure of the concentration of dissolved salts, as explained in the table "Properties of Seawater" in Section 14. Salinity values in the open oceans at mid-latitude typically fall between 34 and 36.

Reference 1 gives details of the method of measurement and an indication of the reliability of the measurements.

SOLUBILITY OF ORGANIC COMPOUNDS IN PRESSURIZED HOT WATER

Liquid water at elevated temperatures and pressures, but still in the subcritical region, is of interest as a solvent in various laboratory and industrial processes. In effect, this means water at a temperature between about 100 °C and 373 °C, the critical temperature, and at pressures up to 400 bar or greater. Since the dielectric constant of water decreases with increasing temperature, the solubility of many compounds, especially non-polar compounds, increases dramatically at higher temperature. The fact that solubility can be fine-tuned by controlling temperature and pressure makes pressurized hot water a useful tool in various extraction and reaction processes.

This table gives a sample of the variations of solubility with temperature and pressure for several compounds, mostly hydrocarbons. The solubility S is expressed in both mole fraction of solute, x_2, and mass percent, $100w_2$, where w_2 is the mass fraction. More information is available in the references.

SOLUBILITY CHART

Abbreviations:

W: soluble in water
A: insoluble in water but soluble in acids
w: sparingly soluble in water but soluble in acids
a: insoluble in water and only sparingly soluble in acids
I: insoluble in water and acids
d: decomposes in water

Fluid Properties

Thermophysical Properties of Water and Steam 6-1
Vapor Pressure and Other Saturation Properties of Water 6-5
Standard Density of Water 6-7
Fixed-Point Properties of H_2O and D_2O 6-9
Properties of Saturated Liquid D_2O 6-10
Properties of Ice and Supercooled Water 6-12
Vapor Pressure of Ice 6-13
Melting Point of Ice as a Function of Pressure 6-14
Permittivity (Dielectric Constant) of Water at Various Frequencies 6-15
Thermophysical Properties of Air 6-16
Thermophysical Properties of Fluids 6-22
Thermophysical Properties of Selected Fluids at Saturation 6-39
Virial Coefficients of Selected Gases 6-48
Mean Free Path and Related Properties of Gases 6-65
Influence of Pressure on Freezing Points 6-66
Critical Constants of Organic Compounds 6-67
Critical Constants of Inorganic Compounds 6-91
Sublimation Pressure of Solids 6-94
Vapor Pressure 6-97
Vapor Pressure of Fluids at Temperatures below 300 K 6-127
Vapor Pressure of Saturated Salt Solutions 6-136
Recommended Data for Vapor-Pressure Calibration 6-137
Enthalpy of Vaporization 6-138
Enthalpy of Fusion 6-154
Compressibility and Expansion Coefficients of Liquids 6-164
Temperature and Pressure Dependence of Liquid Density 6-166
Volumetric Properties of Aqueous Sodium Chloride Solutions 6-171
Properties of Cryogenic Fluids 6-172
Properties of Liquid Helium 6-173
Properties of Refrigerants 6-174
Properties of Gas Clathrate Hydrates 6-177
Ionic Liquids 6-182
Density and Specific Volume of Mercury 6-186
Thermal Properties of Mercury 6-187
Melting Curve of Mercury 6-188
Vapor Pressure of Mercury 6-189
Surface Tension of Common Liquids 6-190
Surface Tension of Aqueous Mixtures 6-195
Surface Active Chemicals (Surfactants) 6-196
Permittivity (Dielectric Constant) of Liquids 6-199
Permittivity (Dielectric Constant) of Gases 6-221
Azeotropic Data for Binary Mixtures 6-222
Viscosity of Gases 6-241
Viscosity of Liquids 6-243
Viscosity and Density of Aqueous Hydroxide Solutions 6-248
Viscosity of Liquid Metals 6-249
Viscosity of Carbon Dioxide along the Saturation Line 6-251
Thermal Conductivity of Gases 6-252
Thermal Conductivity of Liquids 6-254
Diffusion in Gases 6-259
Diffusion of Gases in Water 6-261
Diffusion Coefficients in Liquids at Infinite Dilution 6-262

THERMOPHYSICAL PROPERTIES OF WATER AND STEAM

Eric W. Lemmon and Allan H. Harvey

These tables summarize the thermophysical properties of water and steam at equilibrium as accepted by the International Association for the Properties of Water and Steam (http://www.iapws.org) for general and scientific use. The thermodynamic properties are calculated from the equation of state of Wagner and Pruß (Ref. 6). The reference state for these tables is the liquid at the triple point, at which the internal energy and entropy are taken as zero. These tables refer to states at 1 bar (100 KPa) pressure with temperatures in °C in the first section; liquid and gaseous states at equilibrium as a function of temperature in the second section; and properties along isobars in the third section. The tabulated properties are pressure (P), density (ρ), enthalpy (H), entropy (S), isochoric heat capacity (C_v), isobaric heat capacity (C_p), speed of sound (u), viscosity (η), thermal conductivity (λ), and static dielectric constant (D). In the saturation tables, the first line of identical temperatures is for the liquid state and the second line is for the vapor state. A duplicate entry in the isobar section indicates a phase transition (liquid-vapor) at that temperature; property values are then given for both phases. These are identified by the high densities in the liquid and the low densities in the vapor. The temperature scale is ITS-90. Additional calculations at state points not listed below can be obtained by using the NIST Standard Reference Data program REFPROP (Ref. 5) or the water-specific program steam (Ref. 2).

The uncertainty in density of the equation of state is 0.0001% at 1 atm in the liquid phase, and 0.001% at other liquid states at pressures up to 10 MPa and temperatures to 423 K. In the vapor phase, the uncertainty is 0.05% or less. The uncertainties rise at higher temperatures and/or pressures, but are generally less than 0.1% in density except at extreme conditions. The uncertainty in pressure in the critical region is 0.1%. The uncertainty of the speed of sound is 0.15% in the vapor and 0.1% or less in the liquid, and increases near the critical region and at high temperatures and pressures. The uncertainty in the isobaric heat capacity is 0.2% in the vapor and 0.1% in the liquid, with increasing values in the critical region and at high pressures. The uncertainties of saturation conditions are 0.025% in vapor pressure, 0.0025% in saturated liquid density, and 0.1% in saturated vapor density. The uncertainties in the saturated densities increase substantially as the critical region is approached.

The uncertainty in density of the equation of state is 0.0001% at 1 atm in the liquid phase, and 0.001% at other liquid states at pressures up to 10 MPa and temperatures to 423 K. In the vapor phase, the uncertainty is 0.05% or less. The uncertainties rise at higher temperatures and/or pressures, but are generally less than 0.1% in density except at extreme conditions. The uncertainty in pressure in the critical region is 0.1%. The uncertainty of the speed of sound is 0.15% in the vapor and 0.1% or less in the liquid, and increases near the critical region and at high temperatures and pressures. The uncertainty in the isobaric heat capacity is 0.2% in the vapor and 0.1% in the liquid, with increasing values in the critical region and at high pressures. The uncertainties of saturation conditions are 0.025% in vapor pressure, 0.0025% in saturated liquid density, and 0.1% in saturated vapor density. The uncertainties in the saturated densities increase substantially as the critical region is approached.

VAPOR PRESSURE AND OTHER SATURATION PROPERTIES OF WATER

Eric W. Lemmon

This table summarizes the vapor pressure, enthalpy (heat) of vaporization, and surface tension γ of water as accepted by the International Association for the Properties of Water and Steam (www.iapws.org) for general and scientific use. The vapor pressure and heat of vaporization are calculated from the equation of state of Wagner and Pruss (Ref. 1). The temperature scale is ITS-90. Additional calculations at state points not listed below can be obtained by using the NIST Standard Reference Data program REFPROP (www.nist.gov/srd/nist23.cfm) or the water-specific program Steam Properties (www.nist.gov/srd/nist10.cfm).

STANDARD DENSITY OF WATER

This table gives the density ρ of water in the temperature range from 0 °C to 100 °C at a pressure of 101325 Pa (one standard atmosphere). Temperatures are given on the ITS-90 scale. From 0 °C to 40 °C the values are taken from the publication in Reference 1 and refer to standard mean ocean water (SMOW), free from dissolved salts and gases. SMOW is a standard water sample of high purity and known isotopic composition. Methods of correcting for different isotopic compositions are discussed in Ref. 2. The remaining values are calculated from the NIST REFPROP program, Ref. 3, which obtains thermodynamic properties from the equation of state of Wagner and Pruss given in Ref. 4.

PROPERTIES OF SATURATED LIQUID D_2O

Allan H. Harvey

Properties of saturated liquid heavy water, D_2O, are given in this table as a function of temperature from the melting point to the critical point. The vapor pressure was calculated from the formulation of Harvey and Lemmon (Ref. 2). The other properties were generated from the NIST REFPROP program (Ref. 1) and are consistent with formulations adopted for general and scientific use by The International Association for the Properties of Water and Steam (IAPWS). The background for the equation of state used for density and heat capacity is given by Hill et al. (Ref. 3), and the background for the transport property correlations is given by Matsunaga and Nagashima (Ref. 4). The unpublished surface tension correlation and the other IAPWS formulations may be found on the IAPWS Web site (http://www.iapws.org). The temperature scale is ITS-90. Additional calculations at state points not listed below can be obtained by using the REFPROP program (http://www.nist.gov/srd/nist23.htm). The properties are

P: vapor pressure
ρ: density
C_p: isobaric heat capacity
η: viscosity
λ: thermal conductivity
σ: surface tension

PROPERTIES OF ICE AND SUPERCOOLED WATER

Allan H. Harvey

The common form of ice at ambient pressure is hexagonal ice, designated as ice Ih (see phase diagram in Section 12). The data given here refer to that form, at standard atmospheric pressure (101.325 kPa). Data have been taken from the references indicated, which in most cases are formulations based on critical evaluation of available experimental data. Most properties are sensitive to the method of preparation of the sample, because air and other gases are sometimes occluded. For this reason, there is often disagreement among values in the literature. For all properties except the dielectric constant of ice, the cited reference contains information on the uncertainty of the property.

Phase Transition Properties (Ref. 2)

$\Delta_{fus}H(0\ °C) = 333.4\ J\ g^{-1}$
$\Delta_{subl}H(0\ °C) = 2834\ J\ g^{-1}$

Properties of Ice Ih and Supercooled Water

ρ**:** mass density (Refs. 2, 3)
α_V**:** cubic expansion coefficient, $\alpha_V = -(1/V)(\partial V/\partial T)_p$ (Refs. 2, 3)
κ_s**:** isentropic compressibility, $\kappa_s = -(1/V)(\partial V/\partial p)_s$ (Refs. 2, 3)
c_p**:** specific heat capacity at constant pressure (Refs. 2, 3)
λ**:** thermal conductivity (Refs. 4, 5)
ε**:** static dielectric constant (relative permittivity) (Ref. 6)

VAPOR PRESSURE OF ICE

The values of the vapor (sublimation) pressure of ice Ih were calculated from the equation recommended by the International Association for the Properties of Water and Steam (IAPWS) in 2008. See Refs. 1 and 2 for details on the uncertainty in different temperature ranges. The first entry in the table is the triple point of water, whose pressure has an uncertainty of 0.010 Pa.

MELTING POINT OF ICE AS A FUNCTION OF PRESSURE

This table gives the melting temperature of ice at various pressures, calculated from the equation for the ice Ih – liquid water phase boundary recommended by the International Association for the Properties of Water and Steam (IAPWS) in 2008. See Refs. 1 and 2 for information on the solid/liquid transitions for high-pressure forms of ice. IAPWS gives the following locations for the triple points where equilibrium exists among two ice forms and liquid water:

Phase transition	*p*/MPa	*t*/°C
ice I – ice III	208.566 MPa	–21.985 °C
ice III – ice V	350.1 MPa	–16.986 °C
ice V – ice VI	632.4 MPa	0.16 °C
ice VI – ice VII	2216 MPa	81.85 °C

PERMITTIVITY (DIELECTRIC CONSTANT) OF WATER AT VARIOUS FREQUENCIES

The permittivity of liquid water in the radiofrequency and microwave regions can be represented by the Debye equation (References 1 and 2):

$$\varepsilon' = \varepsilon_\infty + \frac{\varepsilon_s - \varepsilon_\infty}{1 + \omega^2\tau^2}$$

$$\varepsilon'' = \frac{(\varepsilon_s - \varepsilon_\infty)\omega\tau}{1 + \omega^2\tau^2}$$

where $\varepsilon = \varepsilon' + i\,\varepsilon''$ is the (complex) relative permittivity (i.e., the absolute permittivity divided by the permittivity of free space $\varepsilon_0 = 8.854 \cdot 10^{-12}$ F m^{-1}). Here ε_s is the static permittivity (see Reference 3 and the table "Thermophysical Properties of Water and Steam" in this Section); ε_∞ is a parameter describing the permittivity in the high frequency limit; τ is the relaxation time for molecular orientation; and $\omega = 2\pi f$ is the angular frequency. The values in this table have been calculated from parameters given in Reference 2:

	0 °C	25 °C	50 °C
ε_∞	5.7	5.2	4.0
τ/ps	17.67	8.27	4.75

Other useful quantities that can be calculated from the values in the table are the loss tangent: $\tan\delta = \varepsilon''/\varepsilon'$ and the absorption coefficient α which describes the power attenuation per unit length ($P = P_0 e^{-\alpha l}$):

$$\alpha = \frac{\pi f \varepsilon''}{c\sqrt{\varepsilon'}}$$

and c is the speed of light. The last equation is valid when $\varepsilon''/\varepsilon' << 1$.

THERMOPHYSICAL PROPERTIES OF AIR

Eric W. Lemmon

These tables summarize the thermophysical properties of air in the liquid and gaseous states as calculated from the pseudo-pure fluid equation of state of Lemmon et al. (2000). The first table refers to liquid and gaseous air at equilibrium as a function of temperature. The tabulated properties are the bubble-point pressure (i.e., pressure at which boiling begins as the pressure of the liquid is lowered); the dew-point pressure (i.e., pressure at which condensation begins as the pressure of the gas is raised); density (ρ); enthalpy (H); entropy (S); isochoric heat capacity (C_v); isobaric heat capacity (C_p); speed of sound (u); viscosity (η); and thermal conductivity (λ). The first line of identical temperatures is the bubble-point (liquid) and the second line is the dew point (vapor). The normal boiling point of air, i.e., the temperature at which the bubble-point pressure reaches 1 standard atmosphere (1.01325 bar), is 78.90 K (–194.25 °C).

The second table gives the properties of air along various isobars. An entry with non-integer temperatures in the isobar section indicates a phase transition (liquid–vapor) at these temperatures; property values are then given for both phases. These are identified by the high densities in the liquid and the low densities in the vapor. Additional calculations at state points not listed below can be obtained by using the NIST program REFPROP (http://www.nist.gov/srd/nist23.cfm).

In the range from the solidification point to 873 K at pressures to 70 MPa, the estimated uncertainty of density values calculated with the equation of state is 0.1%. The estimated uncertainty of calculated speed-of-sound values is 0.2%, and that for calculated heat capacities is 1%. At temperatures above 873 K and 70 MPa, the estimated uncertainty of calculated density values is 0.5%, increasing to 1.0% at 2000 K and 2000 MPa.

[a] Freezing point for the liquid state.

THERMOPHYSICAL PROPERTIES OF FLUIDS

Eric W. Lemmon

These tables give thermodynamic and transport properties of a variety of fluids, as generated from the equations of state presented in the references below. The properties tabulated are pressure (P), density (ρ), enthalpy (H), entropy (S), isochoric heat capacity (C_v), isobaric heat capacity (C_p), speed of sound (u), viscosity (η), thermal conductivity (λ), and static dielectric constant (D). All extensive properties are given on a mass basis. Not all properties are included for every substance. The references should be consulted for information on the uncertainties.

Values are given first along the saturation line. The first two points are the properties at the triple point. The final line gives the properties at the critical point. Two lines are given for each temperature (except at the critical point); the first line gives the values of the liquid phase (note the high density) and the second line gives the values of the vapor phase (at low densities). Following the saturation tables, values are given as a function of temperature for several isobars. A duplicate entry in the isobar section indicates a phase transition (liquid–vapor) at that temperature; property values are then given for both phases. The phase can be determined by noting the sharp decrease in density between two successive temperature entries; all lines above this point refer to the liquid phase, and all lines below refer to the gas phase. If there is no sharp discontinuity in density, all data in the table refer to the supercritical region (*i.e.*, the isobar is above the critical pressure). If the first temperature in the isobars is not an integer, this state point refers to the properties of the liquid at the melting line.

All temperatures are given on ITS-90, except those for oxygen (Ref. 16) and helium (Ref. 13), where the source equations of state still use the IPTS-68 temperature scale. Nitrogen, oxygen, and argon use a reference state based on zero enthalpy in the gas phase at 0 K; parahydrogen, helium, methane, and ethane use a reference state of zero enthalpy and entropy at the saturated liquid state at the normal boiling point; and propane and carbon dioxide use a reference state of 200 kJ kg^{-1} and 1 kJ kg^{-1} K^{-1}, respectively, at –40 °C. Additional calculations at state points not listed below and for fluids not contained here can be obtained at the NIST Chemistry WebBook website (webbook.nist.gov/chemistry/fluid/), or by using the NIST Standard Reference Data program REFPROP (Ref. 9).

THERMOPHYSICAL PROPERTIES OF SELECTED FLUIDS AT SATURATION

Eric W. Lemmon

These tables give thermodynamic and transport properties of a variety of fluids, as generated from the equations of state presented in the references below. The properties tabulated are pressure (P), density (ρ), enthalpy (H), entropy (S), isochoric heat capacity (C_v), isobaric heat capacity (C_p), speed of sound (u), viscosity (η), thermal conductivity (λ), and static dielectric constant (D). All extensive properties are given on a mass basis. Not all properties are included for every substance. The references should be consulted for information on the uncertainties. Values are given along the saturation line. The first two lines give the properties at the triple point (except for R-1234yf). The final line gives the properties at the critical point. Two lines are given for each temperature (except at the critical point); the first line gives the values of the liquid phase (note the high density), and the second line gives the values of the vapor phase (at low densities). Ammonia uses a reference state based on zero energy and entropy at the triple point; benzene, carbon monoxide, ethylene, hydrogen sulfide, sulfur dioxide, and toluene use a reference state of zero enthalpy and entropy at the saturated liquid state at the normal boiling point; butane, isobutane, ethanol, propylene, R-134a, R-1234yf, and sulfur hexafluoride use a reference state of 200 kJ kg^{-1} and 1 kJ kg^{-1} K^{-1} at –40 °C. Additional calculations at state points not listed below and for fluids not contained here can be obtained at the NIST Chemistry WebBook website (http://webbook.nist.gov/chemistry/fluid/), or by using the NIST Standard Reference Data program REFPROP (http://www.nist.gov/srd/nist23.cfm).

VIRIAL COEFFICIENTS OF SELECTED GASES

Henry V. Kehiaian

This table gives second virial coefficients of about 110 inorganic and organic gases as a function of temperature. Selected data from the literature have been fitted by least squares to the equation

$$B / \mathrm{cm^3 mol^{-1}} = \sum_{i=1}^{n} a(i)[(T_0 / T) - 1]^{i-1}$$

where T_0 = 298.15 K. The table gives values of B at fixed temperature increments, as calculated from this smoothing equation. The first row (lowest temperature) for each compound includes the coefficients $a(i)$ for that compound. Compounds are listed by name.

The equation may be used with the tabulated coefficients for interpolation within the indicated temperature range. It should not be used for extrapolation beyond this range. A useful compilation of virial coefficient data from the literature may be found in the reference.

MEAN FREE PATH AND RELATED PROPERTIES OF GASES

In the simplest version of the kinetic theory of gases, molecules are treated as hard spheres of diameter d which make binary collisions only. In this approximation the mean distance traveled by a molecule between successive collisions, the mean free path l, is related to the collision diameter by:

$$l = \frac{kT}{\pi\sqrt{2}Pd^2}$$

where P is the pressure, T the absolute temperature, and k the Boltzmann constant. At standard conditions (P = 100,000 Pa and T = 298.15 K) this relation becomes:

$$l = \frac{9.27 \cdot 10^{27}}{d^2}$$

where l and d are in meters.

Using the same model and the same standard pressure, the collision diameter can be calculated from the viscosity η by the kinetic theory relation:

$$\eta = \frac{2.67 \cdot 10^{-20}(MT)^{1/2}}{d^2}$$

where η is in units of μPa s and M is the molar mass in g/mol. Kinetic theory also gives a relation for the mean velocity $\bar{v}$ of molecules of mass m:

$$\bar{v} = \left(\frac{8kT}{\pi m}\right)^{1/2} = 145.5(T/M)^{1/2}\ \text{m/s}$$

Finally, the mean time τ between collisions can be calculated from the relation $\tau\bar{v} = l$.

The table below gives values of l, $\bar{v}$, and τ for some common gases at 25 °C and atmospheric pressure, as well as the value of d, all calculated from measured gas viscosities (see References 2 and 3 and the table "Viscosity of Gases" in this section). It is seen from the above equations that the mean free path varies directly with T and inversely with P, while the mean velocity varies as the square root of T and, in this approximation, is independent of P.

A more accurate model, in which molecular interactions are described by a Lennard-Jones potential, gives mean free path values about 5% lower than this table (see Reference 4).

INFLUENCE OF PRESSURE ON FREEZING POINTS

This table illustrates the variation of the freezing point of representative types of liquids with pressure. Substances are listed in alphabetical order. Note that 1 MPa = 0.01 kbar = 9.87 atm.

CRITICAL CONSTANTS OF ORGANIC COMPOUNDS

Chris D. Muzny, Vladimir Diky, Andrei Kazakov, Robert D. Chirico, and Michael Frenkel

The parameters of the liquid-gas critical point are important constants in determining the behavior of fluids. This table lists the critical temperature, pressure, and molar volume, as well as the normal boiling point, for over 850 organic substances. The properties and their units are:

T_b: Normal boiling point in K at a pressure of 101.325 kPa (1 atmosphere); "sp" following the value indicates a sublimation point (temperature at which the solid is in equilibrium with the gas at a pressure of 101.325 kPa)
T_c: Critical temperature in K
P_c: Critical pressure in MPa
V_c: Critical molar volume in $cm^3\ mol^{-1}$

The listed values of the critical constants are critically evaluated using the NIST ThermoData Engine, TDE (Ref. 1), designed to implement the dynamic data evaluation concept (Refs. 2–5). This concept requires large electronic databases capable of storing essentially all relevant experimental data known to date with detailed descriptions of metadata and uncertainties. The combination of these electronic databases with expert-system software, designed to automatically generate recommended property values based on available experimental and predicted data, leads to the ability to produce critically evaluated data dynamically or "to order." The evaluated data have been generated only for compounds for which experimental data for critical properties are available. Group contribution methods such as Joback-Reed (Ref. 6), Constantinou-Gani (Ref. 7), Marrero-Pardillo (Ref. 8), and Wilson-Jasperson (Ref. 9) as well as quantitative structure-property relationship (QSPR) methods (Ref. 5) were used within the TDE environment to validate available experimental data. Each recommended value in the table is characterized with a combined expanded uncertainty (Ref. 10) (level of confidence, approximately 95%) listed in parentheses. Only references to original experimental data actually used by TDE to generate critically evaluated data are indicated for each compound. Compounds are listed alphabetically by name.

The values of the normal boiling temperatures provided in the table along with the combined expanded uncertainities listed in parentheses have also been critically evaluated using TDE. Additional details on the determination of the normal boiling temperatures using TDE can be found in the Physical Constants of Organic Compounds table in Section 3. The remaining values of the normal boiling temperatures (without uncertainities) are taken from the same table.

CRITICAL CONSTANTS OF INORGANIC COMPOUNDS

The parameters of the liquid-gas critical point are important constants in determining the behavior of fluids. This table lists the critical temperature, pressure, and molar volume, as well as the normal boiling point, for over 140 inorganic substances. The properties and their units are:

T_b: Normal boiling point in K at a pressure of 101.325 kPa (1 atmosphere); an "sp" following the value indicates a sublimation point (temperature at which the solid is in equilibrium with the gas at a pressure of 101.325 kPa)
T_c: Critical temperature in K
P_c: Critical pressure in MPa
V_c: Critical molar volume in $cm^3\ mol^{-1}$

The number of digits given for T_b, T_c, and P_c indicates the estimated accuracy of these quantities; however, values of T_c greater than 750 K may be in error by 10 K or more. Although most V_c values are given to three figures, they cannot be assumed accurate to better than a few percent.

All values are experimentally determined except for a few values, indicated by an asterisk*, that are based on extrapolations. Methods of measurement are described and critiqued in Reference 1. Compounds are listed alphabetically by name.

Name	Formula	T_b/K	T_c/K	P_c/MPa	V_c/cm³ mol⁻¹	Ref.
Aluminum	Al	2792	6700 *			2

SUBLIMATION PRESSURE OF SOLIDS

This table gives the sublimation (vapor) pressure of some representative solids as a function of temperature. Entries include simple inorganic and organic substances in their solid phase below room temperature, as well as polycyclic organic compounds which show measurable sublimation pressure only at elevated temperatures. Substances are listed by molecular formula in the Hill order, with inorganic compounds preceeding compounds containing carbon. Values marked by * represent the solid–liquid–gas triple point. Note that some pressure values are in pascals (Pa) and others are in kilopascals (kPa). For conversion, 1 kPa = 7.506 mmHg = 0.0098692 atm.

VAPOR PRESSURE

This table gives vapor pressure data for about 1700 substances. In order to accommodate elements and compounds ranging from refractory to highly volatile in a single table, the temperature at which the vapor pressure reaches specified pressure values is listed. The pressure values run in decade steps from 1 Pa (about 7.5 μm Hg) to 100 kPa (about 750 mm Hg). All temperatures are given in °C. The symbol "s" following a value indicates that the substance is a solid at that temperature.

The data used in preparing the table came from a large number of sources; the main references used for each substance are indicated. Since the data were refit in most cases, values appearing in this table may not be identical with values in the source cited. The temperature entry in the 100 kPa column is close to, but not identical with, the normal boiling point (which is defined as the temperature at which the vapor pressure reaches 101.325 kPa). Although some temperatures are quoted to 0.1 °C, uncertainties of several degrees should generally be assumed. The footnote "e" indicates that some values were obtained by extrapolation (usually with an Antoine equation) beyond the region for which experimental measurements were available and are thus subject to even greater uncertainty.

More extensive and detailed vapor pressure data on selected important substances appear in other tables in this section of the *Handbook*. These substances are flagged by a footnote.

[a] More detailed data on this compound can be found in "Vapor Pressure of Fluids at Temperatures below 300 K" in Sec. 6.
[b] See also "Recommended Data for Vapor-Pressure Calibration" in Sec. 6.
[c] See also "Vapor Pressure of Ice" and "Vapor Pressure and Other Saturation Properties of Water" in Sec. 6.
[d] Values at higher temperatures were calculated from ideal gas thermodynamic functions.
[e] Some values for this compound have been extrapolated beyond the region where experimental values exist.

VAPOR PRESSURE OF FLUIDS AT TEMPERATURES BELOW 300 K

This table gives vapor pressures of 65 important fluids in the temperature range 2 K to 300 K. The data have been taken from evaluated sources, as indicated in the references. The symbol s appearing as a superscript on a vapor pressure value indicates that the substance is solid at that temperature.

Pressures are given in kilopascals (kPa). Note that:

1 kPa = 7.50062 Torr
100 kPa = 1 bar
101.325 kPa = 1 atm

VAPOR PRESSURE OF SATURATED SALT SOLUTIONS

This table gives the vapor pressure of water above saturated solutions of some common salts at ambient temperatures. Data on pure water are given on the last line for comparison.

The references provide additional information on water activity, osmotic coefficient, and enthalpy of vaporization.

RECOMMENDED DATA FOR VAPOR-PRESSURE CALIBRATION

Eric W. Lemmon

These precise vapor pressure values are recommended as secondary standards. Values are given in kPa (1 kPa = 0.0098692 atm = 7.5006 Torr). References for water and CO_2 are given in the *Thermophysical Properties of Fluids* table.

ENTHALPY OF VAPORIZATION

The molar enthalpy (heat) of vaporization $\Delta_{vap}H$, which is defined as the enthalpy change in the conversion of one mole of liquid to gas at constant temperature, is tabulated here for about 950 inorganic and organic compounds. Values are given, when available, both at the normal boiling point t_b, referred to a pressure of 101.325 kPa (760 mmHg), and at 25 °C.

The values in this table were measured either by calorimetric techniques or by application of the Claperyon equation to the variation of vapor pressure with temperature. See Reference 1 for a discussion of the accuracy of different experimental techniques and methods of estimating enthalpy of vaporization at other temperatures. Several of the references present empirical techniques for correlating enthalpy of vaporization with molecular structure.

Compounds are listed by systematic name.

ENTHALPY OF FUSION

This table lists the molar enthalpy (heat) of fusion, $\Delta_{fus}H$, of over 1100 inorganic and organic compounds. All values refer to the enthalpy change at equilibrium between the liquid phase and the most stable solid phase at the phase transition temperature. Most values of $\Delta_{fus}H$ are given at the normal melting point t_m. However, a "tp" following the entry in the melting point column indicates a triple–point temperature, where the solid, liquid, and gas phases are in equilibrium. Temperatures are given on the ITS–90 scale.

Substances are listed by name, either an IUPAC systematic name or, in the case of drugs and other complex compounds, a common synonym. The molecular formula in the Hill convention is included.

[a] The value of $\Delta_{fus}H$ includes the enthalpy of transition between two crystalline phases whose transformation occurs within 1 °C of the melting point.

COMPRESSIBILITY AND EXPANSION COEFFICIENTS OF LIQUIDS

This table gives data on the variation of the density of some common liquids with pressure and temperature. The pressure dependence is described to first order by the isothermal compressibility coefficient κ defined as

$$\kappa_T = -(1/V)\,(\partial V/\partial P)_T$$

where V is the volume and P the pressure, and the temperature dependence by the cubic expansion coefficient α,

$$\alpha_V = (1/V)\,(\partial V/\partial T)_P$$

Substances are listed alphabetically by name. More precise data on the variation of density with temperature over a wide temperature range can be found in Reference 1.

TEMPERATURE AND PRESSURE DEPENDENCE OF LIQUID DENSITY

Ivan Cibulka

This table records parameters of the Tait equation (Refs. 1,2) that gives the ratio between the density at pressure P, $\rho(T,P)$, relative to the density at a reference pressure, $\rho(T,P_{ref})$, at the same temperature T:

$$\frac{\rho(T,P)}{\rho(T,P_{ref})} = \frac{1}{1 - C(T)\ln\dfrac{B(T)+P}{B(T)+P_{ref}}},$$

$$C(T) = a_1 + b_1(T/\mathrm{K}) + c_1(T/\mathrm{K})^2, \qquad (1)$$

$$B(T)/\mathrm{MPa} = a_2 + a_3(T/\mathrm{K}) + a_4(T/\mathrm{K})^2 + a_5(T/\mathrm{K})^3 + a_6(T/\mathrm{K})^4$$

Parameters a_i (i = 1, ..., 6) and b_1, c_1 were adjusted to selected experimental data using the weighted least-squares method. Parameters b_1 and c_1 are zero for most substances, and therefore their values are given in footnotes for those few substances where the statistical significance was justified. The reference pressure is P_{ref} = 0.101325 MPa at temperatures either at or below the normal boiling point temperature (T_{nbp}) and $P_{ref} = P_{sat}(T)$ (saturated vapor pressure) at temperatures $T > T_{nbp}$. Ranges of validity of the equation (T_{min}, T_{max}, P_{max}) are derived from ranges of experimental data; the minimal pressure of validity is taken as P_{ref}, *i.e.*, interpolation between P_{ref} and lowest experimental pressure is allowed. The upper limit of application is the freezing line (if not limited by the ranges of validity). To avoid any large-scale extrapolation, the validity ranges are rectangular areas ($T_{max} - T_{min}$)P_{max}. If in particular temperature interval(s) the maximum experimental pressure exceeded the given value of P_{max}, then the maximum pressure given in the table is denoted by (r) which means that the validity range given in the table is a rectangular subset of the non-rectangular experimental T, P range. In a few cases P_{max} is given as a ratio where the first value corresponds to T_{min} and the second one to T_{max}, *i.e.*, the validity range has approximately a trapezoidal shape. Values of parameters were taken from the papers (Refs. 3–10) where detailed information on the fits, experimental data, and application ranges is available. The numerical values of the parameters are different from those reported in papers (Refs. 3–10) since the forms of polynomials $C(T)$ and $B(T)$ differ. Besides, the parameters recorded in the table below must not necessarily correspond to those in Refs. 3–10 since some fits were updated using newly published experimental data.

In the second line for each substance, the parameters of the smoothing function for the density at reference pressure $\rho(T,P_{ref})$ are given. The functions are either the polynomial expansion,

$$\rho(T,P_{ref})/(\mathrm{kg\,m^{-3}}) = \sum_{i=1}^{N_p} a_i (T/\mathrm{K})^{(i-1)} \qquad (2)$$

or the expansion,

$$\rho(T,P_{ref}) = \rho_c \left[1 + \sum_{i=1}^{N_p} a_i (1-T_r)^{(i/3)}\right], \quad T_r = T/T_c \qquad (3)$$

where N_p is the number of adjustable parameters. Values of the critical density ρ_c and the critical temperature T_c used for the fits using Eq. 3 are also recorded in the table. Parameters were mostly taken from Refs. 3–10, those for 1-alkanols C_1 to C_{10} and n-alkanes C_5 to C_{16} are from Ref. 11. Data used for the fits were predominantly recommended values published in the TRC Thermodynamic Tables (Refs. 12,13), sometimes combined with the original experimental data or, in a few cases, the original experimental data were correlated.

RMSD is a relative root-mean-square deviation (in per cent) between experimental values of density and those calculated from the particular function (Tait Eq. 1 or Eqs. 2, 3);

$$RMSD/\% = 100\left[\frac{1}{N}\sum_{i=1}^{N}\left(\frac{\rho_{exp}-\rho_{calc}}{\rho_{exp}}\right)^2\right]^{1/2}$$

where N is the number of experimental values included in the fit.

If the maximum temperature T_{max} of validity of the Tait equation is greater than the normal boiling point temperature T_{nbp}, then parameters of the Wagner equation in the form of either

$$P_{sat}(T) = P_c \exp\frac{a_1(1-T_r) + a_2(1-T_r)^{1.5} + a_3(1-T_r)^{2.5} + a_4(1-T_r)^5}{T_r} \qquad (4)$$

or

$$P_{sat}(T) = P_c \exp\frac{a_1(1-T_r) + a_2(1-T_r)^{1.5} + a_3(1-T_r)^3 + a_4(1-T_r)^6}{T_r} \qquad (5)$$

where $T_r = T/T_c$ are recorded in the third line for each substance. Values of the critical pressure P_c and critical temperature T_c used in Eqs. 4 and 5 are also recorded in the table (values of the critical temperature may differ a little from those recorded for the function, Eq. 3). Parameters of Eqs. 4 and 5 were taken mostly from the papers by McGarry (Ref. 14) and Ambrose and Walton (Ref. 15); in a few cases, the fits were performed using original experimental data or in combination with the recommended values from the TRC Thermodynamic Tables (Refs. 12,13).

The two right-hand-most columns gives values of the isothermal compressibility coefficient, $\kappa_T = -(1/V)(\partial V/\partial P)_T = (1/\rho)(\partial\rho/\partial P)_T$, and the isobaric cubic expansion coefficient, $\alpha_p = (1/V)(\partial V/\partial T)_p = -(1/\rho)(\partial\rho/\partial T)_p$, calculated for T = 298.15 K and P = 0.101325 MPa from the Tait Eq. 1 and from the $\rho(T, P_{ref})$ equation, respectively. In a very few cases when the lower temperature limit of the Tait equation T_{min} is greater than 298.15 K, the extrapolated values of isothermal compressibility are given.

VOLUMETRIC PROPERTIES OF AQUEOUS SODIUM CHLORIDE SOLUTIONS

This table gives the following properties of aqueous solutions of NaCl as a function of temperature and concentration:

Specific volume v (reciprocal of density)
Isothermal compressibility $\kappa_T = -(1/v)(\partial v/\partial P)_T$
Cubic expansion coefficient $\alpha_v = (1/v)(\partial v/\partial T)_P$

All data refer to a pressure of 100 kPa (1 bar). The reference gives properties over a wider range of temperature and pressure.

PROPERTIES OF CRYOGENIC FLUIDS

Eric W. Lemmon

This table gives physical and thermodynamic properties of ten cryogenic fluids. The properties are:

M	Molar mass
T_t	Triple-point temperature
P_t	Triple-point pressure
ρ_t (l)	Liquid density at the triple point
$\Delta_{fus}H$ @ T_t	Enthalpy of fusion at the triple point
T_b	Normal boiling point at a pressure of 101.325 kPa (760 mmHg)
$\Delta_{vap}H$ @ T_b	Enthalpy of vaporization at the normal boiling point
ρ @ T_b	Density at the normal boiling point for the liquid (l) or vapor (v)
C_p @ T_b	Heat capacity at constant pressure at the normal boiling point for the liquid (l) or vapor (v)
u @ T_b	Speed of sound at the normal boiling point for the liquid (l) or vapor (v)
T_c	Critical temperature
P_c	Critical pressure
ρ_c	Critical density

All properties except the heat of fusion are calculated from the REFPROP program, see Reference 4. Temperatures are listed on the ITS-90 scale, except those values for neon and oxygen that are obtained from older equations of state based on the IPTS-68 temperature scale. The references for all fluids except air, helium, neon, krypton, and xenon are given in the *Thermophysical Properties of Fluids* table. The properties of hydrogen are given for the para form of the molecule (see the Leachman et al. reference for details).

The triple-point temperature of air is the solidification temperature of the liquid (see Reference 2 for details). The boiling-point temperature for air is the bubble-point temperature (i.e., the temperature at which boiling begins as the pressure of the liquid is lowered). The dew-point (vapor) properties of air at 101.325 kPa are calculated at a temperature of 81.72 K; the liquid and vapor properties of these two state points are not in equilibrium. The triple-point properties of helium are given at the temperature of the lambda line (change from normal-to-superfluid helium) for the saturated-liquid state.

PROPERTIES OF LIQUID HELIUM

The following data were obtained by a critical evaluation of all existing experimental measurements on liquid helium, using a fitting procedure described in the reference. All values refer to liquid helium at saturated vapor pressure; temperatures are on the ITS-90 scale. Several properties show a singularity at the lambda point (2.1768 K).

p: vapor pressure
ρ: density
C_s: molar heat capacity
$\Delta_{vap}H$: molar enthalpy of vaporization
ε: relative permittivity (dielectric constant)
σ: surface tension
α_V: cubic expansion coefficient
η: viscosity
λ: thermal conductivity

PROPERTIES OF REFRIGERANTS

This table gives physical properties and safe exposure limits for compounds that have been used as working fluids in traditional refrigeration systems or are under consideration as replacements in newer systems. Some are also used as solvents and blowing agents. Many of the compounds listed are believed to be less harmful to the environment than the traditional halocarbon refrigerants.

Compounds are listed by chemical name. Their ASHRAE standard refrigerant designations (Reference 1) appear in the second column. The ASHRAE codes are often prefixed by symbols such as CFC- (for chlorofluorocarbon), HCFC- (for hydrochlorofluorocarbon), or simply R- (for refrigerant). The "R" number assigned to refrigerants is specified by ANSI/ASHRAE Standard 34. This system is most useful for the hydrocarbons and halocarbons with one to three carbons; for such molecules the chemical composition can be determined from the number and vice versa. The first digit on the far right is the number of fluorine atoms in the compound. The second digit from the right is one more than the number of hydrogen atoms. The third digit from the right is one less than the number of carbon atoms; for single-carbon compounds, this digit is omitted. The fourth digit from the right is equal to the number of unsaturated carbon–carbon bonds; for saturated compounds, this digit is omitted. The number of bromine and iodine atoms is indicated, if needed, by appending "Bn" or "In" to the digits specified by the above rules, where "n" is the number of bromine or iodine atoms. All atoms not specified by the above are assumed to be chlorine. Appended lowercase letter(s) designate different isomers. Additional rules are used to specify cyclic compounds, ethers, inorganic fluids (R700- and R7000-series), miscellaneous organic compounds (R600-series), and blends (R400- and R500-series).

The properties tabulated are

t_m: normal melting point in °C (tp indicates a triple point)
t_b: normal boiling point in °C at 101.325 kPa or 760 mmHg (sp indicates a sublimation point)
t_c: critical temperature in °C
TWA: Threshold limit value, expressed as the time-weighted average over an 8-hr workday and 40-hr workweek, for safe exposure to the vapor; expressed as parts per million by volume.
STEL: Short-term exposure limit, which should not be exceeded for more than 15 min.

Further references and additional data on the critical properties may be found in the tables "Critical Constants of Organic Compounds" and "Critical Constants of Inorganic Compounds" in this section. Details on threshold limits are given in Section 16.

PROPERTIES OF GAS CLATHRATE HYDRATES

Carolyn A. Koh and E. Dendy Sloan

Gas clathrate hydrates (also known as gas hydrates) are crystalline inclusion compounds composed of hydrogen-bonded water cavities (host) which encage small gas (guest) molecules. Generally, a maximum of one guest molecule occupies each water cavity. Typical guest molecules that form gas hydrates are methane, ethane, carbon dioxide, and propane (see gas hydrate phase equilibria data in Table II). The structural and physical properties of gas hydrates are given in Tables Ia and Ib. Data have been taken from the references indicated.

Table Ia. Gas Hydrate Structural Properties (Ref. 1)

Structure	**sI**		**sII**		**sH**		
Crystal system	Cubic		Cubic		Hexagonal		
Space group	Pm3n (No. 223)[b]		Fd3m (No. 227)[b]		P6/mmm (No. 191)[b]		
Lattice description	Primitive		Face centered		Hexagonal		
Lattice parameters[a]	a = 12 Å $\alpha = \beta = \gamma = 90^o$		a = 17.3 Å $\alpha = \beta = \gamma = 90^o$		a = 12.2 Å, c = 10.1 Å $\alpha = \beta = 90^o$, $\gamma = 120^o$		
Ideal unit cell formula	$6(5^{12}6^2)\cdot 2(5^{12})\cdot 46H_2O$		$8(5^{12}6^4)\cdot 16(5^{12})\cdot 136H_2O$		$1(5^{12}6^8)\cdot 3(5^{12})\cdot 2(4^35^66^3)\cdot 34H_2O$		
Cavity	Small	Large	Small	Large	Small	Medium	Large
Description	5^{12}	$5^{12}6^2$	5^{12}	$5^{12}6^4$	5^{12}	$4^35^66^3$	$5^{12}6^8$
Number of cavities/unit cell	2	6	16	8	3	2	1
Average cavity radius[c] **(Å)**	3.95	4.33	3.91	4.73	3.94[d]	4.04[d]	5.79[d]
H_2O molecules/cavity[e]	20	24	20	28	20	20	36

[a] Lattice parameters are a function of temperature, pressure, and guest composition. Typical average values given.
[b] Space group reference numbers from the International Tables of Crystallography.
[c] The average cavity radius will vary with temperature, pressure, and guest composition.
[d] From the atomic coordinates measured using single crystal x-ray diffraction on 2,2-dimethylpentane·5(Xe,H_2S)·34H_2O at 173 K (Ref. 2). The Rietveld refinement package, GSAS was used to determine the atomic distances for each cage oxygen to the cage center.
[e] Number of oxygen atoms at the periphery of each cavity.

Table Ib. Physical Properties of sI, sII Hydrates Compared to Ice, Ih (Refs. 1,3,4,5)

Property	**Ice**	**sI**	**sII**
Dielectric constant at 273 K	94	~58	~58
H_2O reorientation time at 273 K (μs)	21	~10	~10
H_2O diffusion jump time (μs)	2.7	>200	>200
Isothermal Young's modulus at 268 K (10^9 Pa)	9.5	8.4[est]	8.2[est]
Poisson's ratio	0.3301[f]	0.31403[f]	0.31119[f]
Bulk modulus (GPa)	9.097[f]	8.762[f]	8.482[f]
Shear modulus (GPa)	3.488[f]	3.574[f]	3.6663[f]
Compressional velocity, V_p (m/s)	3870.1[f]	3778[f]	3821.8[f]
Shear velocity, V_s (m/s)	1949[f]	1963.6	2001.14[g]
Linear thermal expansion at 200 K (K^{-1})	56 x 10^{-6}	77 x 10^{-6}	52 x 10^{-6}
Thermal conductivity (W $m^{-1}K^{-1}$) at 263 K	2.18±0.01[h]	0.51±0.01[h]	0.50±0.01[h]
Adiabatic bulk compression at 273 K (GPa)	12	14[est]	14[est]
Heat capacity (J $kg^{-1}K^{-1}$)	1700±200[h]	2080	2130±40[h]
Refractive index (632.8 nm, –3 °C)	1.3082 (Ref. 9)	1.346 (Ref. 9)	1.350 (Ref. 9)
Density (g/cm^3)	0.91[j]	0.94	1.291[k]

[f] At 253–268 K, 22.4–32.8 MPa (ice, Ih), 258–288 K, 27.1–62.1 MPa (CH_4, sI), 258–288 K, 30.5–91.6 MPa (CH_4–C_2H_6, sII), Ref. 6.
[g] At 258–288 K, 26.6–62.1 MPa, Ref. 7.
[h] At 248–268 K (ice, Ih), 253–288 K (CH_4, sI), 248–265.5 K (THF, sII), Ref. 8.
[j] Fractional occupancy (calculated from a theoretical model) in small (S) and large (L) cavities: sI = CH_4: 0.87 (S) and CH_4: 0.973 (L); sII = CH_4: 0.672 (S), 0.057 (L); C_2H_6: 0.096 (L) only; C_3H_8: 0.84 (L) only.
[k] Calculated for 2,2-dimethylpentane·5(Xe,H_2S)·34H_2O, Ref. 2; est = estimated.

Table II: Phase Equilibria Data of Gas Clathrate Hydrates

This table gives measured phase equilibria data of sI and sII gas clathrate hydrates (see Table I for gas hydrate structure and physical property data). The temperature and pressure conditions at which gas hydrates are stable are listed here for typical guest molecules (Tables IIa–d). For example, data for methane hydrate show that at 277.1 K methane hydrate will dissociate at pressures below 3.81 MPa.

IONIC LIQUIDS

Ionic liquids are a class of organic salts with relatively low melting points. The term usually implies a melting point of 100 °C or lower, and many are liquid at room temperature. They offer several advantages as solvents, such as very low vapor pressure, good thermal stability, and nonflammable behavior. For these reasons they are attractive as constituents of environmentally friendly chemical processes.

This table lists some of the ionic liquids that have been studied. The following properties are given:

Mol. form. — molecular formula in the Hill convention
CASRN — Chemical Abstracts Service Registry Number
Mol. wt. — molecular weight (relative molar mass)
t_m — normal melting point in °C; the notation "gl" indicates a glass–liquid transition, rather than a crystal–liquid transition
ρ — density in g/cm^3. The superscript indicates the temperature in °C; if there is no superscript, room temperature can be assumed.
η — viscosity in mPa s. The superscript indicates the temperature in °C; if there is no superscript, room temperature can be assumed.

The phase behavior of ionic liquids can be complicated. Some are crystalline at low temperatures and show a sharp transition from crystal to liquid state (a true melting point) as the temperature is raised, but others exist as a glass at low temperatures and convert to a liquid at the glass–liquid transition temperature, denoted by a small change in heat capacity. Still others are glasses at very low temperatures, transform to crystals as the temperature is raised, and finally become liquid at a still higher temperature. See Reference 3 for a discussion of the types of phase behavior.

DENSITY AND SPECIFIC VOLUME OF MERCURY

The data in this table have been adjusted to the ITS-90 temperature scale. The uncertainty in density values is 0.0003 g/mL between –20 and –10 °C; 0.0001 or less between –10 and 200 °C; and 0.0002 between 200 and 300 °C.

THERMAL PROPERTIES OF MERCURY

Lev R. Fokin

This table gives thermal properties of solid, liquid, and gaseous mercury over a range of temperature. The properties tabulated are:

- Molar heat capacity: C_p/J mol^{-1} K^{-1} of the solid (Ref. 1, 2), liquid (Ref. 3), and gas (Ref. 3)
- Cubic thermal expansion coefficient: $10^4 \times \alpha$/K^{-1} of the liquid (Ref. 4)
- Isothermal compressibility coefficient: $10^6 \times \kappa$/bar^{-1} of the liquid (Ref. 4)
- Speed of sound: u/m s^{-1} in the liquid (Ref. 4)

The last three properties are defined as follows (v is the specific volume):

$$\alpha = \frac{1}{v}\left(\frac{\partial v}{\partial T}\right)_p \qquad \kappa_T = -\frac{1}{v}\left(\frac{\partial v}{\partial P}\right)_T \qquad u^2 = \left(\frac{\partial P}{\partial \rho}\right)_s \qquad \rho = v^{-1}$$

MELTING CURVE OF MERCURY

The solid–liquid phase boundary of mercury provides a convenient means of calibrating pressures up to 1 GPa in the neighborhood of room temperature. The best representation of this curve is given by:

$$p/\text{GPa} = 1.932845 \cdot 10^{-2} d + 1.8333 \cdot 10^{-6} d^2 + 5.9791 \cdot 10^{-8} d^3$$

where $d = t/°\text{C} - 38.8344$. Temperature is on the ITS-90 scale, and the relation is valid for pressures up to about 1.2 GPa. The following table is calculated from this equation.

p* vs. *t		***t* vs. *p***	
***t*/°C**	***p*/GPa**	***p*/GPa**	***t*/°C**
–38.83	0.000	0.010	–38.32

VAPOR PRESSURE OF MERCURY

The following table gives the vapor pressure of mercury in kilopascals (100 kPa = 1 bar) from the triple point (234.3156 K) to the critical point (1764 K). The data are generated from the formulation of Huber, Laesecke, and Friend in Reference 1, which is based on a critical evaluation of all the published data on mercury vapor pressure and related thermodynamic properties. The estimated uncertainty in the vapor pressure is:

–38 to –10 °C	3%
0 to 130 °C	1%
140 to 350 °C	0.15%
360 to 620 °C	0.5%
630 to 1491 °C	5%

Most of the entries in this table carry one significant figure beyond the estimated accuracy.

Note that the table refers to mercury vapor in equilibrium with liquid mercury, in the absence of air or other gases.

SURFACE TENSION OF COMMON LIQUIDS

Ian H. Bell

The surface tension γ of about 230 liquids is tabulated here as a function of temperature. Values of γ are given in units of millinewtons per meter (mN m^{-1}), which is equivalent to dyn cm^{-1} in cgs units. The uncertainty of the values is 0.1 to 0.2 mN m^{-1} or less in most cases. Values at temperatures between the points tabulated can be obtained by linear interpolation to a good approximation. Substances are listed alphabetically by name. A more extensive compilation of surface tension may be found in Reference 1.

Most of the values from Ref. 1 were obtained by capiliary measurements in which the liquid phase is in contact with its vapor plus air at ambient pressure. Values from Ref. 3-6 refer to measurements in which the liquid and vapor phases are in equlibrium, in the absence of other gases. Details may be found in the references.

SURFACE TENSION OF AQUEOUS MIXTURES

The composition dependence of the surface tension of binary mixtures of several compounds with water is given in this table. The data are tabulated as a function of the mass percent of the non-aqueous component. Data for methanol, ethanol, 1-propanol, and 2-propanol are taken from Reference 1, which also gives values at other temperatures.

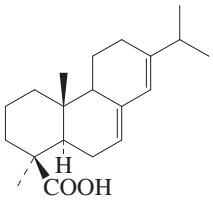
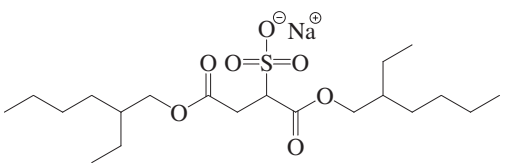
SURFACE ACTIVE CHEMICALS (SURFACTANTS)

Thomas J. Bruno and Paris D. N. Svoronos

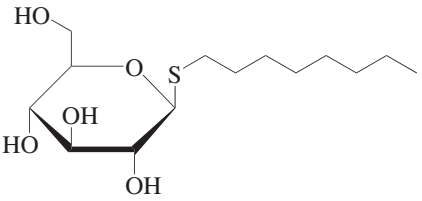
The following table provides the structure and properties of common surface active chemicals or surfactants (Refs. 1-3). These reagents are used industrially to decrease surface tension in many different applications, and they are used in the laboratory in many analytical and biochemical procedures. In this way, the table complements many of the tables presented in Sections 7 and 8, in which these surfactants are incorporated in reagents. The table is arranged alphabetically according to chemical name, although the most common generic name or abbreviation is provided in bold type (unless the chemical name is also the most common name). The surfactant class is provided (anionic, cationic, or nonionic). Anionic surfactants are molecules in which the hydrophilic moiety is a negatively charged group such as a sulfonate, sulfate, or carboxylate. Cationic surfactants are molecules in which the hydrophilic moiety is a positively charged group such as a quaternary ammonium ion. Nonionic surfactants are molecules in which the hydrophilic moiety is uncharged, such as an ethoxylate. Another classification exists, though not represented here, called amphoteric surfactants, in which the ionic character is pH dependent.

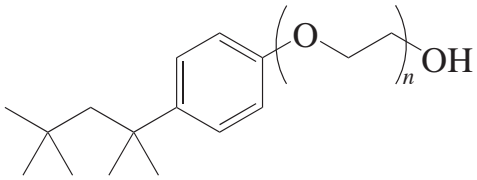


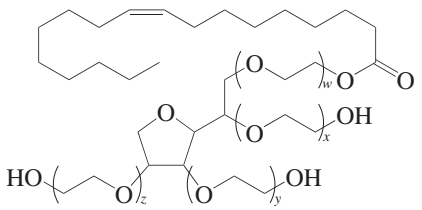


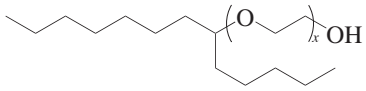
Where available, the melting and normal boiling temperatures are provided; if decomposition occurs before this state point is reached, this is indicated by the notation "dec." The measured density of either the liquid or a solution is provided, along with temperature, where possible. The predicted density, while available for some surfactants in which measurements are unavailable, is not provided here.

Where available, the critical micelle concentration (CMC), the concentration of the surfactant above which micelles spontaneously form, is provided. The preferred unit is mmol/L, but in the case of mixtures, this is provided as a percent or ppm, usually on the basis of mass (mass/mass). The CMC is dependent on temperature and the ionic strength of the solution, and is also dependent to some extent on the measurement technique. For anionic and cationic surfactants, the CMC is reduced by increasing ionic strength, but temperature has a minor effect. For nonionic surfactants, the CMC is relatively insensitive to ionic strength, but increases with increases in temperature. For the CMC values given here, the temperature is provided where possible. If not specified, the temperature is to be regarded as ambient.









Where available, the aggregation number is provided (Refs. 1, 4, and 5). This is the mean number of surfactant molecules present in a micelle after the CMC has been reached. It is measured using luminescent probes by varying surfactant concentration, and it is dependent on temperature and the concentration of any organic or ionic species present. Finally, the hydrophilic lipophilic balance (HLB) is provided where available. This is a fit-for-purpose property rather than a fundamental property which has evolved in definition and determination since being devised, a matter beyond the scope of this entry. The HLB is a numerical scale between 0 and 20 descriptive of the tendency of a surfactant to be either hydrophilic or hydrophobic. A relatively high HLB (greater than 10) indicates hydrophilicity, or good water or polar solvent solubility. A relatively low HLB (lower than 10) indicates lipophilicity, or good solubility in nonpolar solvents such as oils or organics. The HLB changes with concentration and mixture composition.

Name	Synonym	Mol. form.	Mol. wt.	bp/°C	mp/°C	Den./ g cm^{-3}	CMC/ mmol L^{-1}	Aggr. no.	HLB	Sol. H_2O
Anionic surfactants										
Abietic acid	Sylvic acid	$C_{20}H_{30}O_2$	302.451	439.5	173.5	1.06^{25}	2 at 25 °C			Insoluble
							**Soluble in:** ethanol, acetone, ether, chloroform, and benzene			**Notes:** Natural product is primary component of resin acid of pine wood; used as bow rosin; used at high pH.
Bis(2-ethylhexyl) sodium sulfosuccinate	Docusate sodium	$C_{20}H_{37}NaO_7S$	444.559	dec	155	1.1^{25}				15 g/L at 25 °C; 23 g/L at 40 °C; 30 g/L at 50 °C; 55 g/L at 70 °C
							**Soluble in:** ethanol (20 g/L), chloroform (300 g/L), diethyl ether (300 g/L), petroleum ether (unlimited), glycerol, carbon tetrachloride, xylene, petroleum ether, acetone, and vegetable oils			**Notes:** Stable in acid and neutral solutions; hydrolyzes in basic media; used as emulsifier. Dispersant, emulsifier, wetting agent, and laxative to treat constipation and earwax removal.

Name	Synonym	Mol. form.	Mol. wt.	bp/°C	mp/°C	Den./ g cm^{-3}	CMC/ mmol L^{-1}	Aggr. no.	HLB	Sol. H_2O
Deoxycholic acid	3,12-Dihydroxycholan-24-oic acid, (3α,5β,12α)	$C_{24}H_{40}O_4$	392.573	dec	177		5 at 25 °C	22	17.6	0.24 mg/mL at 15 °C
							Soluble in: ethanol (1 g/100 mL at 20 °C), acetone, ether, and chloroform			**Notes:** Readily dialyzable; used in a modified procedure to recover 40% - 80% of a protein; pK_a = 6.58; λ_{max} = 310 nm; specific rotation +55°; forms molecular coordination compounds; complexes with fatty acids; sodium salt is much more soluble (333 mg/mL in water at 15 °C) but its aqueous solutions precipitate at pH < 5.
Perfluorobutanesulfonic acid	PFBS	$C_4HF_9O_3S$	300.1	211	≈80	1.811^{25}				reacts violently
										Notes: Used as a replacement for perfluoroctanesulfonic acid stain repellent.
Sodium dodecyl sulfate	Sodium lauryl sulfate	$C_{12}H_{25}NaO_4S$	288.38	dec	205	1.06^{25}	8.2 at 25 °C	62	40	200 mg/mL at 20 °C
							Soluble in: ethanol			**Notes:** Aid in lysing cells during DNA extraction and for unraveling proteins in SDS-PAGE; low pK_a; can be used in pH as low as 4; can be prone to foaming.
Cationic surfactant										
Cetyltrimethylammonium bromide	CTAB	$C_{19}H_{42}N$	364.45	dec	240		1 at 25 °C	75-170	≈10	0.3 g/100 mL at 20 °C
							Soluble in: alcohols, slightly soluble in acetone; insoluble in diethyl ether and benzene			**Notes:** Aid in high molecular mass DNA isolation and PCR analysis; titrant for perchlorate; phase transfer catalyst in arene and heterocycle reductions.
Ionic (amphiphilic) surfactant										
Sodium lauroyl sarcosinate	Gardol	$C_{15}H_{28}NNaO_3$	293.378	dec	140					7.0% - 8.6% mass/mass
										Notes: Amphiphilic surfactant used to inhibit D transcription, as a foam stabilizer; lubricant; corrosion inhibitor; bacteriostat; used in emulsion polymerization.
Nonionic surfactants										
Dodecyl-β-D-maltoside	DDM	$C_{24}H_{46}O_{11}$	510.62	dec	225	1.26^{25}	0.15 - 0.17 at 25 °C	70-140	≈10	soluble
										Notes: Used to aid in the solubilization and isolation of hydrophobic membrane proteins to preserve their activity.
Ethoxylated tall oil	Ethofat 242/25		945.0	dec		1.08^{25a}	4[a] at 25 °C		12.2	soluble
										Notes: Derived from tall oil obtained from paper processing, can be used at wide range of pH.
Glycerol1-dodecanoate,(±)-	Glycerol 1-laurate (±)-	$C_{15}H_{30}O_4$	274.397	397	63.2					12.67 mg/L at 25 °C
							Soluble in: methanol and chloroform (50 mg/L)			**Notes:** White fluffy semisolid; has shown both antibacterial and antiviral activity *in vitro*; used against some infections but clinical studies are incomplete; used in deodorants and in some cases as an emulsifier in food additives; used as a methane mitigation agent in ruminants.

Name	Synonym	Mol. form.	Mol. wt.	bp/°C	mp/°C	Den./ g cm^{-3}	CMC/ mmol L^{-1}	Aggr. no.	HLB	Sol. H_2O
Octyl-β-D-1-thioglucopyranoside	OTG	$C_{14}H_{28}O_5S$	308.43	dec	128		9 at 25 °C			slightly soluble
							**Soluble in:** ethanol (50 mg/mL)			**Notes:** Colorless powder; used for cell lysis and for solubilizing proteins without denaturing them; dialyzable.
Polyethylene glycol *tert*-octylphenyl ether	Triton X-100		647.0	270	6	1.07^{25}	0.2 - 0.9 at 25 °C	140	13.5	soluble
							**Soluble in:** benzene, toluene, xylene, trichloroethylene, ethylene glycol, ethyl ether, ethanol, isopropanol, and ethylene dichloride			**Notes:** Nonionic surfactant and emulsifier widely used for solubilizing membrane proteins and lysing cells; no antimicrobial properties; absorbs in the UV, so can interfere with protein quantitation.
Polyoxyethylene (20) sorbitan monolaurate	Tween 20	$C_{58}H_{114}O_{26}$	1227.54	dec		1.06^{25}	0.06 at 25 °C	62	16.7	soluble
										Notes: Washing agent in immunoassay; lysing mammalian cells; used industrially in cleaning applications.
Polyoxyethylene (20) sorbitan monooleate	Tween 80	$C_{64}H_{124}O_{26}$	1310.0	dec		1.07^{25}			13.4-15	soluble
 $w + x + y + z = 20$										**Notes:** Used to stabilize aqueous drug formulations; emulsifier for drugs; surfactant used in cosmetics and soaps, and in mouthwash.
Tergitol	Secondary alcohol ethoxylate			dec		1.006^{20}	52 ppm (mass/mass)			soluble
							**Soluble in:** chlorinated solvents and most polar organics			**Notes:** Pale yellow liquid; pH (1% aqueous solution) 7.1; chemically stable in the presence of dilute acids, bases, and salts; compatible with anionic, cationic, and other nonionic surfactants; used in chemical analysis, high-performance cleaners and agrochemicals; member of the large Tergitol family of surfactants.

[a] Typical value

PERMITTIVITY (DIELECTRIC CONSTANT) OF LIQUIDS

Christian Wohlfarth

The permittivity of a substance (often called the dielectric constant) is the ratio of the electric displacement D to the electric field strength E when an external field is applied to the substance. The quantity tabulated here is the relative permittivity, which is the ratio of the actual permittivity to the permittivity of a vacuum; it is a dimensionless number.

The table gives the static relative permittivity ε, i.e., the relative permittivity measured in static fields or at low frequencies where no relaxation effects occur. The third column of the table lists the value of ε at the temperature in °C specified by the superscript. When available, a temperature close to 20 °C was chosen, or (as it is the case for many of the substances included here) ε is given at the only temperature for which data are available.

The static permittivity refers to nominal atmospheric pressure as long as the corresponding temperature is below the normal boiling point. Otherwise, at temperatures above the normal boiling point, the pressure is understood to be the saturated vapor pressure of the substance.

For substances where information on the temperature dependence of the permittivity is available, the table gives the coefficients of a simple polynomial fitting of permittivity to temperature with an equation of the form

$$\varepsilon(T) = a + bT + cT^2 + dT^3$$

where T is the absolute temperature in K. The temperature range of the fit is given in the last column. The coefficients of the fitting equation can be used to calculate dielectric constants within the fitted temperature range but should not be used for extrapolation outside this range. The user who needs dielectric constant data with more accuracy than can be provided by this equation is referred to Reference 1, which gives the original data together with their literature source.

Substances are listed by systematic name. The notation E-xy means 10^{-xy}.

PERMITTIVITY (DIELECTRIC CONSTANT) OF GASES

This table gives the relative permittivity ε (often called the dielectric constant) of some common gases at a temperature of 20 °C and pressure of one atmosphere (101.325 kPa). Values of the permanent dipole moment μ in Debye Units (1 D = 3.33564×10^{-30} C m) are also included.

The density dependence of the permittivity is given by the equation

$$\frac{\varepsilon - 1}{\varepsilon + 2} = \rho_m \left(\frac{4\pi N\alpha}{3} + \frac{4\pi N\mu^2}{9kT} \right)$$

where ρ_m is the molar density, N is Avogadro's number, k is the Boltzmann constant, T is the temperature, and α is the molecular polarizability. Therefore, in regions where the gas can be considered ideal, $\varepsilon - 1$ is approximately proportional to the pressure at constant temperature. For nonpolar gases ($\mu = 0$), $\varepsilon - 1$ is inversely proportional to temperature at constant pressure.

The number of significant figures indicates the accuracy of the values given. The values of ε for air, Ar, H_2, He, N_2, O_2, and CO_2 are recommended as reference values; these are accurate to 1 ppm or better.

The second part of the table gives the permittivity of water vapor in equilibrium with liquid water as a function of temperature (derived from Reference 4).

AZEOTROPIC DATA FOR BINARY MIXTURES

J. Gmehling, J. Menke, J. Krafczyk, K. Fischer, J.-C. Fontaine, and H. V. Kehiaian

Binary homogeneous (single-phase) liquid mixtures having an extremum (maximum or minimum) vapor pressure P at constant temperature T, as a function of composition, are called azeotropic mixtures, or simply azeotropes. The composition is usually expressed as mole fractions, where x_1 for component 1 in the liquid phase and y_1 for component 1 in the vapor phase are identical. Mixtures that do not show a maximum or minimum are called zeotropic. A maximum (minimum) of the $P(x_1)$ or $P(y_1)$ curves corresponds to a minimum (maximum) of the boiling temperature T at constant P, plotted as a function of x_1 or y_1 [see $T(x_1)$ and $T(y_1)$ curves, Types I and III, in Fig. 1]. Azeotropes in which the pressure is a maximum (temperature is a minimum) are often called positive azeotropes, while pressure-minimum (temperature-maximum) azeotropes are called negative azeotropes. The coordinates of an azeotropic point are the azeotropic temperature T_{Az}, pressure P_{Az}, and the vapor-phase composition $y_{1,Az}$, which is the same as the liquid-phase composition $x_{1,Az}$.

In the two-phase liquid-liquid region of partially miscible (heterogeneous) mixtures, the vapor pressure at constant T (or the boiling temperature at constant P) is independent of the global composition x_1 of the two coexisting liquid phases between the equilibrium compositions x_1' and x_1'' ($x_1' < x_1''$).

The constant vapor pressure (boiling temperature) above the two-phase region of certain partially miscible mixtures is usually larger (smaller) than the vapor pressure (boiling temperature) at any other liquid-phase composition in the homogeneous region. In this case, the vapor-phase composition is inside the miscibility gap. Mixtures of this type are called heteroazeotropic mixtures, or simply heteroazeotropes. (Fig. 1, Type II), as opposed to the other types of azeotropes, called homoazeotropes.

Only in a few cases partially miscible mixtures present a positive or negative azeotropic point in the single-phase region, outside the miscibility gap, similar to the azeotropic points of homogeneous mixtures (Fig. 1, Types IV and VI).

A few binary mixtures, for example the system perfluorobenzene + benzene, may present two azeotropic points at constant temperature (pressure), a positive and a negative one. They are called double azeotropic mixtures, or simply double azeotropes. (Fig. 1, Type V).

The knowledge of the occurrence of azeotropic points in binary and higher systems is of special importance for the design of distillation processes. The number of theoretical stages of a distillation column required for the separation depends on the separation factor α_{12}, i.e., the ratio of the K_i-factors ($K_i = y_i/x_i$) of the components i (i = 1, 2). The required separation factor can be calculated with the following simplified relation (Reference 1):

$$\alpha_{12} = K_1/K_2 = (y_1/x_1)/(y_2/x_2) = (\gamma_1 P_1^s)/(\gamma_2 P_2^s) \qquad (1)$$

where γ_i is the activity coefficient of component i in the liquid phase and P_i^s is the vapor pressure of the pure component i.

In distillation processes, only the difference between the separation factor and unity ($\alpha_{12} - 1$) can be exploited for the separation. If the separation factor is close to unity, a large number of theoretical stages is required for the separation. If the binary system to be separated shows an azeotropic point ($\alpha_{12} = 1$), the separation is impossible by ordinary distillation, even with an infinitely large number of stages.

Following eq. (1) azeotropic behavior will always occur in homogeneous binary systems when the vapor pressure ratio P_1^s/P_2^s is equal to the ratio of the activity coefficients γ_2/γ_1.

Various thermodynamic methods based on g^E-models (Wilson, NRTL, UNIQUAC) or group contribution methods (UNIFAC, modified UNIFAC, ASOG, PSRK) can be used for either calculating or predicting the required activity coefficients for the components under given conditions of temperature and composition (Reference 2).

Because of the importance of azeotropic data for the design of distillation processes, compilations have been available in book form for quite some time (References 3-7). The most recent printed data collection was published in 1994 (Reference 8). A revised and extended version appeared in 2004 (Reference 9).

A collection of approximately 47,400 zeotropic and azeotropic data sets, compiled from 6600 references, are stored in a comprehensive computerized data bank (Reference 10). The references from the above-mentioned compilations and from the vapor-liquid equilibrium part of the Dortmund Data Bank (Reference 11) were supplemented by references found from CAS online searches, private communications, data from industry, etc.. Over 24,000 zeotropic data and over 20,000 azeotropic data are available for binary systems. Nearly 90% of the binary azeotropic data show a pressure maximum. In most cases (ca. 90%) these are homogeneous azeotropes, and in approximately 7–8% of the cases heterogeneous azeotropes are reported. Less than 10% of the data stored show a pressure minimum. Approximately 21,000 of the data sets stored were published after 1970.

The table below provides information about azeotropes for 808 selected binary systems. Compounds are listed in the modified Hill order, with carbon-containing compounds following those compounds not containing carbon. In columns 1 and 2 are the molecular formulas of components 1 and 2 written in the Hill convention. In column 3 the names of the components are given, either a systematic IUPAC name or a name in ubiquitous use. Columns 4, 5, and 6 contain the azeotropic coordinates of the mixtures: temperature T_{Az}, pressure P_{Az}, and vapor-phase composition $y_{1,Az}$. The explanation of the type of azeotrope (column 7) is given by the following codes:

- O: homogeneous azeotrope in a completely miscible system
- L: homogeneous azeotrope in a partially miscible system
- E: heterogeneous azeotrope
- X: pressure maximum
- N: pressure minimum
- D: double azeotrope
- C: system contains a supercritical compound

VISCOSITY OF GASES

Marcia L. Huber and Allan H. Harvey

The following table gives the viscosity of some common gases as a function of temperature. Since the difference between the viscosity at 100 kPa and the limiting value at zero pressure is generally less than 2%, these values may be used for pressures ranging from very low to normal atmospheric pressure. Uncertainties for the viscosities of gases in this table are usually less than 3%; uncertainty information on specific fluids can be found in the references. Viscosity is given in units of μPa s; note that 1 μPa s = 10^{-5} poise. Substances are listed by name.

VISCOSITY OF LIQUIDS

The absolute viscosity of some common liquids at temperatures between –25 °C and 100 °C is given in this table. Values were derived by fitting experimental data to suitable expressions for the temperature dependence. The substances are arranged by name. All values are given in units of millipascal seconds (mPa s); this unit is identical to centipoise (cp).

Viscosity values correspond to a nominal pressure of 1 atmosphere. However, if a value is given at a temperature above the normal boiling point, the applicable pressure is understood to be the vapor pressure of the liquid at that temperature. A few values are given at a temperature slightly below the normal freezing point; these refer to the supercooled liquid.

The accuracy ranges from 1% in the best cases to 5 to 10% in the worst cases. Additional significant figures are included in the table to facilitate interpolation.

VISCOSITY AND DENSITY OF AQUEOUS HYDROXIDE SOLUTIONS

The viscosity and density of aqueous hydroxide solutions at 25 °C are tabulated here as a function of concentration. Viscosity is given in millipascal second, which is equal to the c.g.s. unit centipoise (cP). The last entry in each column refers to the saturated solution.

VISCOSITY OF LIQUID METALS

This table gives the viscosity of several liquid metals as a function of temperature. Experimental data from some of the references was smoothed to produce the table. Viscosity is given in millipascal second (mPa s), which equals the c.g.s. unit centipoise (cP).

THERMAL CONDUCTIVITY OF GASES

Marcia L. Huber and Allan H. Harvey

The following table gives the thermal conductivity of some common gases as a function of temperature. The difference between the thermal conductivity at 100 kPa and the limiting value at zero pressure is usually less than 1%. Uncertainties for the thermal conductivities of gases in this table are generally less than 3%; uncertainty information on specific fluids can be found in the references. Thermal conductivity is given in units of mW $m^{-1} K^{-1}$.

Name	Formula	p/kPa	λ(100 K)/ mW $m^{-1} K^{-1}$	λ(200 K)/ mW $m^{-1} K^{-1}$	λ(300 K)/ mW $m^{-1} K^{-1}$	λ(400 K)/ mW $m^{-1} K^{-1}$	λ(500 K)/ mW $m^{-1} K^{-1}$	λ(600 K)/ mW $m^{-1} K^{-1}$	Ref.

THERMAL CONDUCTIVITY OF LIQUIDS

This table gives the thermal conductivity λ of 275 liquids at temperatures between –25 °C and 100 °C. Values refer to nominal atmospheric pressure; however, when an entry is given for a temperature above the normal boiling point of the liquid, the pressure is understood to be the saturation vapor pressure at that temperature. Reference 1 contains data on many of these liquids at high pressures. Data on halocarbon refrigerants over a wide range of temperature and pressure may be found in Reference 6.

Values given to three decimal places (i.e., to 0.001 W/m K) have an uncertainty of 2% to 5%. Values given to 0.0001 W/m K should be accurate to 1% or better.

DIFFUSION IN GASES

This table gives diffusion coefficients D_{12} for binary gas mixtures as a function of temperature. Values refer to atmospheric pressure. The diffusion coefficient is inversely proportional to pressure as long as the gas is in a regime where binary collisions dominate. See Reference 1 for a discussion of the dependence of D_{12} on temperature and composition.

DIFFUSION OF GASES IN WATER

This table gives values of the diffusion coefficient, *D,* for diffusion of several common gases in water at various temperatures. For simple one-dimensional transport, the diffusion coefficient describes the time–rate of change of concentration, d*c*/d*t,* through the equation

$$dc/dt = D d^2c/dx^2$$

where x is, for example, the perpendicular distance from a gas–liquid interface. The values below have been selected from the references indicated; in some cases data have been refitted to permit interpolation in temperature.

Gas–liquid diffusion coefficients are difficult to measure, and large differences are found between values obtained by different authors and through different experimental methods. See References 1 and 2 for a discussion of measurement techniques.

DIFFUSION COEFFICIENTS IN LIQUIDS AT INFINITE DILUTION

This table lists diffusion coefficients D_{AB} at infinite dilution for some binary liquid mixtures. Values are given at 25 °C when available; it should be noted that the diffusion coefficient generally increases by 10% to 20% for a 10 °C increase above ambient temperature.

Solvents are listed in alphabetical order, as are the solutes within each solvent group.

PROPERTIES OF AMINO ACIDS

This table gives selected properties of some important amino acids and closely related compounds. Compounds are listed by name in alphabetical order. The three-letter symbol is included for the 20 "standard" amino acids that are the basic constituents of proteins. Structures are given in the following table.

Symbol: Three-letter symbol for standard amino acids
M_r: Molecular weight
t_m: Melting point
pK_a, pK_b, pK_c, pK_d: Negative of the logarithm of the acid dissociation constants for the COOH and NH_2 groups (and, in some cases, other groups) in the molecule (at 25 °C)
pI: pH at the isoelectric point
S: Solubility in water in units of grams of compound per kilogram of water. A temperature of 25 °C is understood unless otherwise stated. When quantitative data are not available, a qualitative indication is given.
$\bar{V}_2$: Partial molar volume in aqueous solution at infinite dilution at 25 °C

Data on the enthalpy of formation of many of these compounds are included in the table "Standard Thermodynamic Properties of Chemical Substances" in Section 5 of this *Handbook*. Absorption spectra and optical rotation data can be found in Reference 3. Partial molar volume is taken from Reference 5; other thermodynamic properties, including solubility as a function of temperature, are given in References 3 and 5. Most of the p*K* values come from References 1, 6, and 7.

PROPERTIES OF PURINE AND PYRIMIDINE BASES

This table lists some of the important purine and pyrimidine bases that occur in nucleic acids. The pK_a values (negative logarithm of the acid dissociation constant) are given for each ionization stage. The last column gives the aqueous solubility S at the indicated temperature in units of grams per 100 grams of solution.

The numbering system in the rings is:

Purine

Pyrimidine

Common name	Systematic name	Mol. form.	Mol. wt.	pK_a values			S/mass % (temp.)
Pyrimidines							
Cytosine	4-Amino-2-hydroxypyrimidine	$C_4H_5N_3O$	111.10	4.60	12.16		0.73 (25 °C)
5-Methylcytosine	4-Amino-2-hydroxy-5-methylpyrimidine	$C_5H_7N_3O$	125.13	4.6	12.4		0.45 (25 °C)
5-Hydroxymethylcytosine	4-Amino-2-hydroxy-5-hydroxymethylpyrimidine	$C_5H_7N_3O_2$	141.13	4.3	13		
Uracil	2,4-Dihydroxypyrimidine	$C_4H_4N_2O_2$	112.09	0.5	9.5	>13	0.27 (25 °C)
Thymine	5-Methyluracil	$C_5H_6N_2O_2$	126.11	9.94	>13		0.35 (25 °C)
Orotic acid	Uracil-6-carboxylic acid	$C_5H_4N_2O_4$	156.10	2.4	9.5	>13	0.18 (18 °C)
Purines							
Adenine	6-Aminopurine	$C_5H_5N_5$	135.14	<1	4.3	9.83	0.104 (25 °C)
Guanine	2-Amino-6-hydroxypurine	$C_5H_5N_5O$	151.13	3.3	9.2	12.3	0.0068 (40 °C)
7-Methylguanine	7-Methyl-2-amino-6-hydroxypurine	$C_6H_7N_5O$	165.16	3.5	9.9		
Isoguanine	6-Amino-2-hydroxypurine	$C_5H_5N_5O$	151.13	4.5	9.0		0.006 (25 °C)
Xanthine	2,6-Dioxopurine	$C_5H_4N_4O_2$	152.11	0.8	7.4	11.1	0.05 (20 °C)
Hypoxanthine	6-Hydroxypurine	$C_5H_4N_4O$	136.11	2.0	8.9	12.1	0.07 (19 °C)
Uric acid	2,6,8-Trihydroxypurine	$C_5H_4N_4O_3$	168.11	5.4	11.3		0.002 (20 °C)

THE GENETIC CODE

This table gives the correspondence between a messenger RNA codon and the amino acid that it specifies. The symbols for bases in the codon are:

U uracil
C cytosine
A adenine
G guanine

The amino acid symbols are given in the table entitled "Structures of Common Amino Acids." A chain-initiating codon is indicated by **init** and a chain-terminating codon by **term**.

Example: UCA codes for **Ser**, UAC codes for **Tyr**, etc.

1st position	**2nd position = U**	**2nd position = C**	**2nd position = A**	**2nd position = G**	**3rd position**
U	Phe	Ser	Tyr	Cys	U
U	Phe	Ser	Tyr	Cys	C
U	Leu	Ser	**term**	**term**	A
U	Leu	Ser	**term**	Trp	G
C	Leu	Pro	His	Arg	U
C	Leu	Pro	His	Arg	C
C	Leu	Pro	Gln	Arg	A
C	Leu	Pro	Gln	Arg	G
A	Ile	Thr	Asn	Ser	U
A	Ile	Thr	Asn	Ser	C
A	Ile	Thr	Lys	Arg	A
A	Met (**init**)	Thr	Lys	Arg	G
G	Val	Ala	Asp	Gly	U
G	Val	Ala	Asp	Gly	C
G	Val	Ala	Glu	Gly	A
G	Val (**init**)	Ala	Glu	Gly	G

PROPERTIES OF FATTY ACIDS AND THEIR METHYL ESTERS

This table gives the names and selected properties of some important fatty acids and their methyl esters. It includes most of the acids that are significant constituents of naturally occurring oils and fats. Compounds are listed first by number of carbon atoms and, secondly, by the degree of unsaturation. Both the systematic name and the common or trivial name are given, as well as the Chemical Abstracts Service Registry Number and the shorthand acid code that is frequently used. The first number in this code gives the number of carbon atoms; the number following the colon is the number of unsaturated centers (mainly double bonds). The location and orientation of the unsaturated centers follow. The symbols used are: c = *cis*; t = *trans*; a = acetylenic center; e = ethylenic center at end of chain; ep = *epoxy*. Thus 9c,11t indicates a double bond with *cis* orientation at the No. 9 carbon and another with *trans* orientation at the No. 11 carbon. More details on the codes can be found in Reference 1.

The table gives the molecular weight and melting point of the acid and the melting and boiling points of the methyl ester of the acid when available. A superscript on the boiling point indicates the pressure in mmHg (torr); if there is no superscript, the value refers to one atmosphere (760 mmHg). The references cover many other fatty acids beyond those listed here and give additional properties.

We are indebted to Frank D. Gunstone for advice on the content of the table.

PROPERTIES OF FATTY ACID METHYL AND ETHYL ESTERS RELATED TO BIOFUELS

Robert D. Chirico and Michael Frenkel

These tables provide critically evaluated properties and sources of experimental data for fatty acid methyl esters and ethyl esters found in biofuels. All listed property values are based on experimental results reported in Refs. 1 to 103. Critical evaluation was carried out dynamically with the NIST ThermoData Engine (TDE) software, version 7.0 released in 2012 (Ref. 104). The software algorithms have been described in the literature (see Refs. 105 to 112). As of March, 2016, the most recent TDE version 10.0 was released by NIST in 2015 (Ref. 113).

The table of properties lists the common name; molecular formula; acid code; normal melting temperature (mp/°C); density of the liquid phase at 25 °C and 50 °C near pressure p = 0.1 MPa (ρ^{25} and ρ^{50} expressed in kg m^{-3}); vapor pressure p_{sat} at the temperatures 100 °C and 150 °C (p_{sat}^{100} and p_{sat}^{150} in Pa); the normal boiling temperature (bp/°C); heat capacity of the liquid phase at 25 °C and 50 °C near pressure p = 0.1 MPa (C_p^{25} and C_p^{50} in J K^{-1} mol^{-1}); and viscosity of the liquid at 25 °C and 50 °C near pressure p = 0.1 MPa (η^{25} and η^{50} in mPa s). In some cases, property values for the liquid cannot be evaluated at 25 °C because the compound is solid at this temperature. In such cases, values are given at 40 °C, as indicated with a superscript "40." All normal boiling temperatures are estimates based on extrapolation of vapor pressures measured at lower temperatures. Digits in parentheses following a property value give the uncertainty in the last digit(s) of the value; these are the estimated expanded uncertainties (0.95 level of confidence; see Refs. 111 to 113) for the property values. A discussion of uncertainty terminology with particular application to thermodynamic and transport properties is given in Ref. 114.

Compounds are listed in order of the acid code. This is a common shorthand in which the first number represents the number of carbon atoms in the parent fatty acid, and the second number indicates the number of double bonds present. See the table "Properties of Fatty Acids and Their Methyl Esters" for further details on the acid code.

The second table provides up to five data sources reporting experimental measurements of the indicated property. Generally, these are the most important sources that were used in the critical evaluation process. The numbers correspond to those in the reference list. The systematic name and CAS Reg. No. are also given here.

Properties of Methyl and Ethyl Esters of Fatty Acids

Common name	Mol. form.	Acid code	mp/°C	bp/°C	ρ^{25}/kg m^{-3}	ρ^{50}/ kg m^{-3}	p_{sat}^{100}/ Pa	p_{sat}^{150}/ Pa	C_p^{25}/ J mol^{-1} K^{-1}	C_p^{50}/ J mol^{-1} K^{-1}	η^{25}/ mPa s	η^{50}/ mPa s

COMPOSITION AND PROPERTIES OF COMMON OILS AND FATS

This table lists some of the most common naturally occurring oils and fats. The oils and fats consist mainly of esters of glycerol (i.e., triglycerides) with fatty acids of 10 to 22 carbon atoms. The four fatty acids with the highest concentration are given for each oil; concentrations are given in weight percent. Because there is often a wide variation in composition depending on the source of the oil sample, a range (or sometimes an average) is generally given. More complete data on composition, including minor fatty acids, sterols, and tocopherols, can be found in the references.

The oils and fats are listed alphabetically by common name. The source - plant, fish and other marine life, or land animal - follows the name.The acids are designated by the codes described in the table "Properties of Fatty Acids and Their Methyl Esters" in this section; that table gives the systematic and common names of the acids. Thus 18:2 9c,12c indicates a C_{18} acid with two double bonds in the 9 and 12 positions, both with a *cis* configuration (*cis,cis*-9,12-octadecadienoic acid, or linoleic acid).

The density and refractive index of the oils are typical values; superscripts indicate the temperature in °C.

Notes:

The composition figure given for oleic acid (18:1 9c) often includes low levels of other 18:1 isomers.

In some oils where a concentration is given for 18:2 9c,12c (linoleic acid), other isomers of 18:2 may be included.

Likewise, where a concentration is given for 18:3 9c,12c,15c (α-linolenic acid), other isomers of 18:3 may be included.

The acid 20:5 6c,9c,12c,15c,17c, which is prevalent in many fish oils, is often abbreviated as 20:5 ω-3 or 20:5 n-3.

Jojoba oil consists primarily of wax esters of the acids listed here and long-chain alcohols.

Kapok oil also contains up to 15% cyclopropene acids.

Stillingia oil also contains 5-10% *trans,cis*-2,4-decadienoic acid (stillingic acid, 10:2 2t,4c).

Capelin oil also contains about 10% 16:1.

The assistance of Frank D. Gunstone in preparing this table is gratefully acknowledged.

CARBOHYDRATE NAMES AND SYMBOLS

The following table lists the systematic names and symbols for selected carbohydrates and some of their derivatives. The symbols for monosaccharide residues and derivatives are recommended by IUPAC for use in describing the structures of oligosaccharide chains. A more complete list can be found in the reference.

McNaught, A. D., *Pure Appl. Chem*. 68, 1919–2008, 1996.

Common name	Symbol	Systematic name
Abequose	Abe	3,6-Dideoxy-D-*xylo*-hexose
N-Acetyl-2-deoxyneur-2-enaminic acid	Neu2en5Ac	
N-Acetylgalactosamine	GalNAc	
N-Acetylglucosamine	GlcNAc	
N-Acetylneuraminic acid	Neu5Ac	
Allose	All	*allo*-Hexose
Altrose	Alt	*altro*-Hexose
Apiose	Api	3-*C*-(Hydroxymethyl)-*glycero*-tetrose
Arabinitol	Ara-ol	Arabinitol
Arabinose	Ara	*arabino*-Pentose
Arcanose		2,6-Dideoxy-3-*C*-methyl-3-*O*-methyl-*xylo*-hexose
Ascarylose		3,6-Dideoxy-L-*arabino*-hexose
Boivinose		2,6-Dideoxy-D-gulose
Chalcose		4,6-Dideoxy-3-*O*-methyl-D-*xylo*-hexose
Cladinose		2,6-Dideoxy-3-*C*-methyl-3-*O*-methyl-L-*ribo*-hexose
Colitose		3,6-Dideoxy-L-*xylo*-hexose
Cymarose		6-Deoxy-3-*O*-methyl-*ribo*-hexose
3-Deoxy-D-*manno*-oct-2-ulosonic acid	Kdo	
2-Deoxyribose	dRib	2-Deoxy-*erythro*-pentose
2,3-Diamino-2,3-dideoxy-D-glucose	GlcN3N	
Diginose		2,6-Dideoxy-3-*O*-methyl-*lyxo*-hexose
Digitalose		6-Deoxy-3-*O*-methyl-D-galactose
Digitoxose		2,6-Dideoxy-D-*ribo*-hexose
3,4-Di-*O*-methylrhamnose	$Rha3,4Me_2$	
Ethyl glucopyranuronate	Glc*p*A6Et	
Evalose		6-Deoxy-3-*C*-methyl-D-mannose
Fructose	Fru	*arabino*-Hex-2-ulose
Fucitol	Fuc-ol	6-Deoxy-D-galactitol
Fucose	Fuc	6-Deoxygalactose
β-D-Galactopyranose 4-sulfate	β-D-Gal*p*4*S*	
Galactosamine	GalN	2-Amino-2-deoxygalactose
Galactose	Gal	*galacto*-Hexose
Glucitol	Glc-ol	
Glucosamine	GlcN	2-Amino-2-deoxyglucose
Glucose	Glc	*gluco*-Hexose
Glucuronic acid	GlcA	
N-Glycoloylneuraminic acid	Neu5Gc	
Gulose	Gul	*gulo*-Hexose
Hamamelose		2-*C*-(Hydroxymethyl)-D-ribose
Idose	Ido	*ido*-Hexose
Iduronic acid	IdoA	
Lactose	Lac	β-D-Galactopyranosyl-(1→4)-D-glucose
Lyxose	Lyx	*lyxo*-Pentose
Maltose		α-D-Glucopyranosyl-(1→4)-D-glucose
Mannose	Man	*manno*-Hexose
2-*C*-Methylxylose	Xyl2*C*Me	
Muramic acid	Mur	2-Amino-3-*O*-[(R)-1-carboxyethyl]-2-deoxy-D-glucose
Mycarose		2,6-Dideoxy-3-*C*-methyl-L-*ribo*-hexose
Mycinose		6-Deoxy-2,3-di-*O*-methyl-D-allose
Neuraminic acid	Neu	5-Amino-3,5-dideoxy-D-*glycero*-D-*galacto*-non-2-ulosonic acid

Common name	Symbol	Systematic name
Panose		α-D-Glucopyranosyl-(1→6)-α-D-glucopyranosyl-(1→4)-D-glucose
Paratose		3,6-Dideoxy-D-*ribo*-hexose
Primeverose		β-D-Xylopyranosyl-(1→6)-D-glucose
Psicose	Psi	*ribo*-Hex-2-ulose
Quinovose	Qui	6-Deoxyglucose
Raffinose		β-D-Fructofuranosyl-α-D-galactopyranosyl-(1→6)-α-D-glucopyranoside
Rhamnose	Rha	6-Deoxymannose
Rhodinose		2,3,6-Trideoxy-L-*threo*-hexose
Ribose	Rib	*ribo*-Pentose
Ribose 5-phosphate	Rib5*P*	
Ribulose	Ribulo (Rul)	*erythro*-Pent-2-ulose
Rutinose		α-L-Rhamnopyranosyl-(1→6)-D-glucose
Sarmentose		2,6-Dideoxy-3-*O*-methyl-D-*xylo*-hexose
Sedoheptulose		D-*altro*-Hept-2-ulose
Sorbose	Sor	*xylo*-Hex-2-ulose
Streptose		5-Deoxy-3-*C*-formyl-L-lyxose
Sucrose		β-D-Fructofuranosyl-α-D-glucopyranoside
Tagatose	Tag	*lyxo*-Hex-2-ulose
Talose	Tal	*talo*-Hexose
Turanose		α-D-Glucopyranosyl-(1→3)-D-fructose
Tyvelose	Tyv	3,6-Dideoxy-D-*arabino*-hexose
Xylose	Xyl	*xylo*-Pentose
Xylulose	Xylulo (Xul)	*threo*-Pent-2-ulose

STANDARD TRANSFORMED GIBBS ENERGIES OF FORMATION FOR BIOCHEMICAL REACTANTS

Robert N. Goldberg and Robert A. Alberty

This table contains values of the standard transformed Gibbs energies of formation $\Delta_f G'^\circ$ for 130 biochemical reactants. Values of $\Delta_f G'^\circ$ are given at pH 7.0, the temperature 298.15 K, and the pressure 100 kPa for three ionic strengths: I = 0, I = 0.1 mol/L and I = 0.25 mol/L. The table can be used for calculating apparent equilibrium constants K' and standard apparent reduction potentials E'° for biochemical reactions. Such a listing is more compact than tabulating the actual apparent equilibrium constants or standard apparent reduction potentials, which would require a very large number of reactant–product combinations. In the table, all reactants are in aqueous solution unless indicated otherwise.

A biochemical reactant is a sum of species. For example, ATP consists of an equilibrium mixture of the aqueous species ATP^{4-}, $HATP^{3-}$, H_2ATP^{2-}, $MgATP^{2-}$, etc. Similarly, phosphate refers to the equilibrium mixture of the aqueous species PO_4^{3-}, HPO_4^{2-}, $H_2PO_4^-$, H_3PO_4, $MgHPO_4$, etc. Biochemical reactions are written using biochemical reactants in terms of an apparent equilibrium constant K', which is distinct from the standard equilibrium constant K. This subject is discussed in an IUPAC report (see Reference 1 below).

The apparent equilibrium constant K' and the standard transformed Gibbs energy change $\Delta_r G'^\circ$ for a biochemical reaction can be calculated from the $\Delta_f G'^\circ$ values by using the relationship

$$-RT \ln K' = \Delta_r G'^\circ = \Sigma \nu'_i \Delta_f G'^\circ,$$

where the summation is over all of the biochemical reactants. The quantity ν'_i is the stoichiometric number of reactant i (ν'_i is positive for reactants on the right side of the equation and negative for reactants on the left side); R is the gas constant. As an example, the hydrolysis reaction of ATP is

$$ATP + H_2O(l) = ADP + phosphate.$$

At pH 7.00 and I = 0.25 M, $\Delta_r G'^\circ$ and K' are calculated as follows:

$$\Delta_r G'^\circ = \{-1424.70 - 1059.49 - (-2292.50 - 155.66)\}\cdot(\text{kJ mol}^{-1}) = -36.03 \text{ kJ mol}^{-1}$$

$$K' = \exp[-(-36030 \text{ J mol}^{-1})/\{(8.3145 \text{ J mol}^{-1} \text{ K}^{-1})\cdot(298.15 \text{ K})\} = 2.05\cdot10^6$$

An example involving a biochemical half-cell reaction is

$$\text{acetaldehyde(aq)} + 2\ e^- = \text{ethanol(aq)}.$$

At 298.15 K, pH 7.00, and I = 0, the standard apparent reduction potential E'° can be calculated as follows

$$E'^\circ = -(1/nF)\cdot\{\Delta_f G'^\circ(\text{ethanol}) - \Delta_f G'^\circ(\text{acetaldehyde})\},$$

where n is the number of electrons in the half-cell reaction and F is the Faraday constant. Then,

$$E'^\circ = [-1/(2\cdot9.6485\cdot10^4 \text{ C mol}^{-1})]\cdot(58.10\cdot10^3 \text{ J mol}^{-1} - 20.83\cdot10^3 \text{ J mol}^{-1}) = -0.193 \text{ V}$$

APPARENT EQUILIBRIUM CONSTANTS FOR ENZYME-CATALYZED REACTIONS

Robert N. Goldberg

This table contains values of apparent equilibrium constants K' for selected enzyme-catalyzed reactions at specified temperatures T and pHs. In those cases where the ionic strength I and/or the pMg (pMg = $-\log_{10}[Mg^{2+}]$) have been reported, the values of these quantities are given. The Enzyme Commission numbers [Ref. 1] of the enzymes that were used to catalyze the reactions are also given.

There are two fundamentally different types of equilibrium constants. This is illustrated by the following example for the hydrolysis of adenosine 5′-triphosphate (ATP) to adenosine 5′-diphosphate (ADP) and phosphate:

$$\text{ATP} + \text{H}_2\text{O} = \text{ADP} + \text{phosphate} \qquad (1)$$

The apparent equilibrium constant for the overall biochemical reaction (1) is

$$K' = [\text{ADP}][\text{phosphate}]/([\text{ATP}]c^\circ) \qquad (2)$$

The biochemical reactants ATP, ADP, and phosphate each exist in several different ionized and metal bound forms. For example, ATP is an equilibrium mixture of the species ATP^{4-}, $HATP^{3-}$, H_2ATP^{2-}, $MgATP^{2-}$, $MgHATP^{-}$, Mg_2ATP^{0}. Additional species would also have to be considered if Ca^{2+} were present. Thus, ATP has often been denoted in the literature as ΣATP or as $(ATP)_{tot}$. When it is clear that one is dealing with total amounts of substances, it is not necessary to use either the Σ or "tot." Thus, these designations are not used in this table. In the above equation, c° = 1 mol dm^{-3}; it is included to make K′ dimensionless. The standard transformed Gibbs energy of reaction $\Delta_r G'^\circ$ at specified conditions of temperature T, pressure P, ionic strength I, pH, and pMg can be calculated from K':

$$\Delta_r G'^\circ = -RT \ln K' \qquad (3)$$

The molar gas constant, R, is equal to 8.314 472 J K^{-1} mol^{-1}. $\Delta_r G'^\circ$ and the apparent equilibrium constant, K', can be used to calculate the position of equilibrium of overall biochemical reactions.

It is also possible to choose a chemical reference reaction that involves selected solute species:

$$ATP^{4-} + H_2O = ADP^{3-} + HPO_4^{2-} + H^+ \qquad (4)$$

The equilibrium constant for this reference reaction is

$$K = [ADP^{3-}][HPO_4^{2-}][H^+]/\{[ATP^{4-}](c^\circ)^2\} \qquad (5)$$

Equations and algorithms that relate these two different types of equilibrium constants have been published [Refs. 2–4]. To calculate the equilibrium constant K for the reference reaction from the apparent equilibrium constant K', or vice versa, one needs the equilibrium constants for the binding of H^+ and for the relevant metal ions to ATP^{4-}, ADP^{3-}, and HPO_4^{2-}.

To avoid confusion between the two different types of equilibrium constants (K' and K) and to avoid ambiguity about whether specific species or sums of species are intended, the word "ammonia," for example, rather than NH_3 or NH_4^+, is used for total ammonia, and chemical formulas are used for specific chemical species. Other substances such as carbon dioxide (CO_2, HCO_3^-, and CO_3^{2-}), and phosphate ($H_2PO_4^-$, HPO_4^{2-}, and PO_4^{3-}) are treated in the same manner. Exceptions are made for water, which is always written as H_2O, and for gaseous hydrogen and oxygen, which are written as $H_2(g)$ and $O_2(g)$, respectively.

For symmetrical reactions, there is no concern about the units used to calculate the value of an equilibrium constant. However, care must be exercised for reactions that are not symmetrical. In such cases, the units "mol dm^{-3}" have been used for all concentrations. As stated above, a c° (1 mol dm^{-3}) is then used to make all equilibrium constants dimensionless.

All substances are assumed to be in aqueous solutions unless specified otherwise.

Values of $\Delta_r G'^\circ$ and K' can also be calculated for many biochemical reactions by using the table "Standard Transformed Gibbs Energies of Formation for Biochemical Reactants" in Section 7 of this Handbook.

Abbreviations

ADP	adenosine 5′-diphosphate
AMP	adenosine 5′-monophosphate
ATP	adenosine 5′-triphosphate
CoA	coenzyme A
GDP	guanosine 5′-diphosphate
GMP	guanosine 5′-monophosphate
GTP	guanosine 5′-triphosphate
IDP	inosine 5′-diphosphate
IMP	inosine 5′-monophosphate
ITP	inosine 5′-triphosphate
NAD_{ox}	β-nicotinamide-adenine dinucleotide, oxidized form
NAD_{red}	β-nicotinamide-adenine dinucleotide, reduced form
$NADP_{ox}$	β-nicotinamide-adenine dinucleotide phosphate, oxidized form
$NADP_{red}$	β-nicotinamide-adenine dinucleotide phosphate, reduced form
UDP	uridine 5′-diphosphate
UTP	uridine 5′-triphosphate

THERMODYNAMIC QUANTITIES FOR THE IONIZATION REACTIONS OF BUFFERS IN WATER

Robert N. Goldberg, Nand Kishore, and Rebecca M. Lennen

This table contains selected values for the pK, standard molar enthalpy of reaction $\Delta_r H°$, and standard molar heat-capacity change $\Delta_r C°_p$ for the ionization reactions of 64 buffers, many of which are relevant to biochemistry and to biology (Ref. 1). The values pertain to the temperature T = 298.15 K and the pressure p = 0.1 MPa. The standard state is the hypothetical ideal solution of unit molality. These data permit one to calculate values of the pK and of $\Delta_r H°$ at temperatures in the vicinity {$T \approx$ (274 K to 350 K)} of the reference temperature θ = 298.15 K by using the following equations (Ref. 2).

$$\Delta_r G°_T = -RT \ln K_T = \ln(10) \cdot RT \cdot pK_T \,, \qquad (1)$$

$$R \ln K_T = -\left(\Delta_r G°_\theta / \theta\right) + \Delta_r H°_\theta \left\{(1/\theta) - (1/T)\right\} + \Delta_r C°_{p\theta} \left\{(\theta/T) - 1 + \ln(T/\theta)\right\} \,, \qquad (2)$$

$$\Delta_r H°_T = \Delta_r H°_\theta + \Delta_r C°_{p\theta}(T - \theta) \,, \qquad (3)$$

Here, $\Delta_r G°$ is the standard molar Gibbs energy change and K is the equilibrium constant for a reaction; R is the gas constant (8.314 462 J K^{-1} mol^{-1}). The subscripts T and θ denote the temperature to which a quantity pertains, the subscript p denotes constant pressure, and the subscript r denotes that the quantity refers to a reaction. Combination of equations (1) and (2) yields the following equation that gives pK as a function of temperature:

$$pK_T = -\{R \cdot \ln(10)\}^{-1}[-\left\{\ln(10) \cdot RT \cdot pK_\theta / \theta\right\} + \Delta_r H°_\theta \{(1/\theta) - 1/T)\} \Delta_r C°_{p\theta} \left\{(\theta/T) - 1 + \ln(T/\theta)\right\} \,, \qquad (4)$$

The above equations neglect higher order terms that involve temperature derivatives of $\Delta_r C°_p$. Also, it is important to recognize that the values of pK and $\Delta_r H°$ effectively pertain to ionic strength I = 0. However, the values of pK and $\Delta_r H°$ are almost always dependent on the ionic strength and the actual composition of the solution. These issues are discussed in Reference 1, which also gives an approximate method for making appropriate corrections.

CAPS	3-(Cyclohexylamino)-1-propanesulfonic acid	221.3	10.4	9.7–11.1

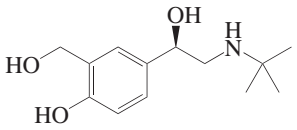
[a] pK_a = 9.0 for the second dissociation stage.

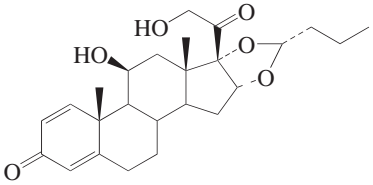
TYPICAL pH VALUES OF BIOLOGICAL MATERIALS AND FOODS

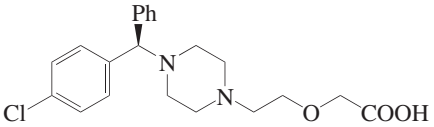
This table gives typical pH ranges for various biological fluids and common foods. All values refer to 25 °C.

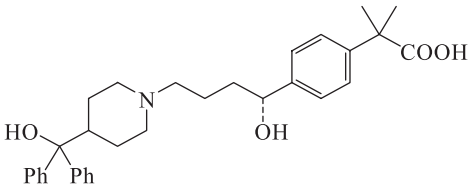
Biological Materials	
Blood, human	7.35–7.45
Blood, dog	6.9–7.2
Spinal fluid, human	7.3–7.5
Saliva, human	6.5–7.5
Gastric contents, human	1.0–3.0
Duodenal contents, human	4.8–8.2
Feces, human	4.6–8.4
Urine, human	4.8–8.4
Milk, human	6.6–7.6
Bile, human	6.8–7.0

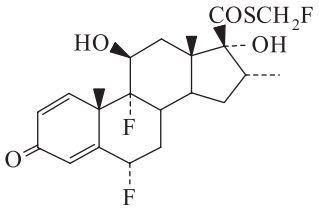
Foods	
Apples	2.9–3.3
Apricots	3.6–4.0
Asparagus	5.4–5.8
Bananas	4.5–4.7
Beans	5.0–6.0
Beers	4.0–5.0
Beets	4.9–5.5
Blackberries	3.2–3.6
Bread, white	5.0–6.0
Butter	6.1–6.4
Cabbage	5.2–5.4
Carrots	4.9–5.3
Cheese	4.8–6.4
Cherries	3.2–4.0
Cider	2.9–3.3
Corn	6.0–6.5
Crackers	6.5–8.5
Dates	6.2–6.4
Eggs, fresh white	7.6–8.0
Flour, wheat	5.5–6.5
Gooseberries	2.8–3.0
Grapefruit	3.0–3.3
Grapes	3.5–4.5
Hominy (lye)	6.8–8.0
Jams, fruit	3.5–4.0
Jellies, fruit	2.8–3.4
Lemons	2.2–2.4
Limes	1.8–2.0
Maple syrup	6.5–7.0
Milk, cows	6.3–6.6
Olives	3.6–3.8
Oranges	3.0–4.0
Oysters	6.1–6.6
Peaches	3.4–3.6
Pears	3.6–4.0
Peas	5.8–6.4
Pickles, dill	3.2–3.6
Pickles, sour	3.0–3.4
Pimento	4.6–5.2
Plums	2.8–3.0
Potatoes	5.6–6.0
Pumpkin	4.8–5.2
Raspberries	3.2–3.6
Rhubarb	3.1–3.2
Salmon	6.1–6.3
Sauerkraut	3.4–3.6
Shrimp	6.8–7.0
Soft drinks	2.0–4.0
Spinach	5.1–5.7
Squash	5.0–5.4
Strawberries	3.0–3.5
Sweet potatoes	5.3–5.6
Tomatoes	4.0–4.4
Tuna	5.9–6.1
Turnips	5.2–5.6
Vinegar	2.4–3.4
Water, drinking	6.5–8.0
Wines	2.8–3.8

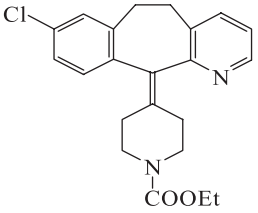




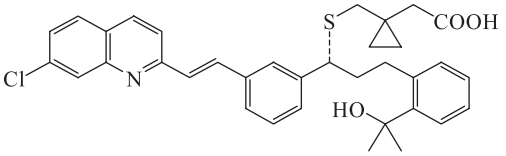


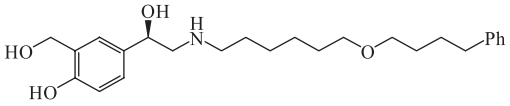


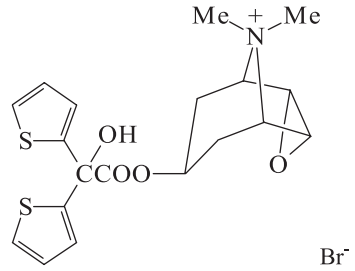


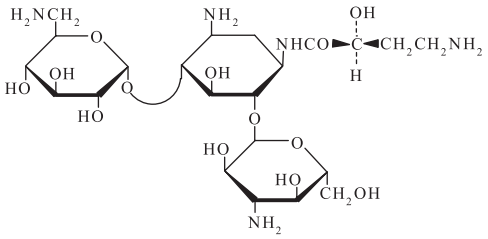


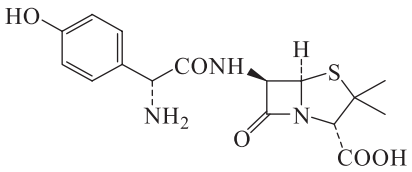
STRUCTURE AND FUNCTIONS OF SOME COMMON DRUGS

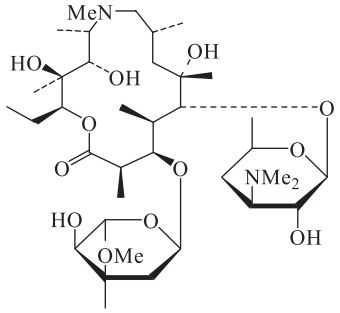


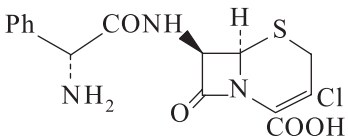


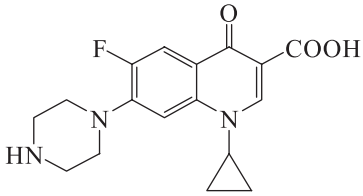




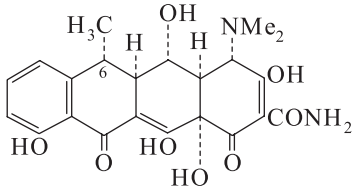


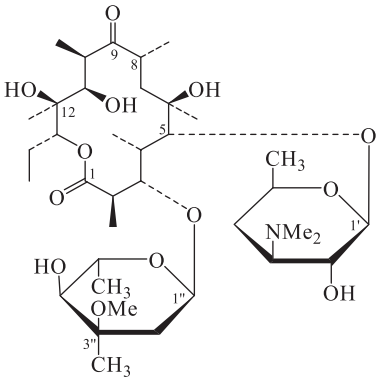


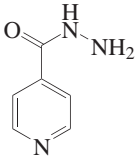


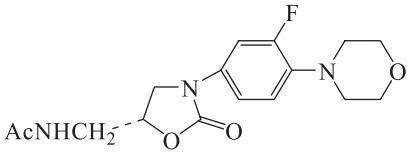


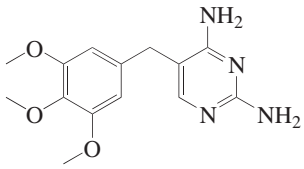
This table lists the names, categories, therapeutic uses, and chemical structures of selected drugs. The generic (chemical) name of each drug is given, along with some of the trade names under which it is sold. When available, physical properties are given in italics in the fourth column. Solubilities are also added in the fourth column. The structure given refers to the active drug, but many of these are packaged as salts or other derivatives. The drugs have been selected to represent a variety of categories; most are widely used throughout the world.

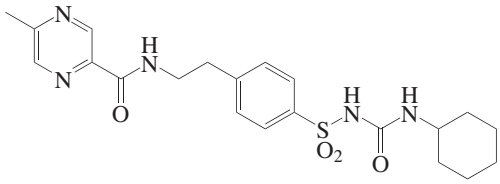


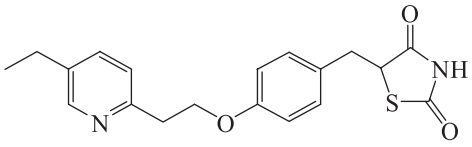


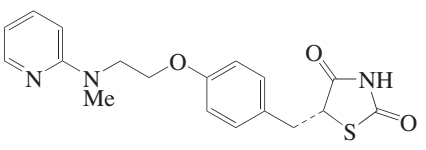












The list is divided into therapeutic categories; within each category the listing is alphabetical by generic name. The index that follows the table can be used to locate a drug by either generic or trade name.

	Generic name	Trade names	Category and properties	Applications	Structure
Antiallargenic agents					
1	Albuterol	Proventil; Ventolin; Volmax	β_2-Andrenergic receptor agonist Soluble in water and slightly soluble in ethanol.	Treatment of troubled breathing caused by asthma, emphysema, and other lung diseases	
2	Budesonide	Budeson; Budamax; Rhinocort; Pulmicort; Inflammide	Glucocorticoid *mp 226 °C* Soluble in DMSO (100 mM), ethanol (50 mM), chloroform, dichloromethane, and methanol. Insoluble in water.	Management of asthma and treatment of inflammatory bowel disease	
3	Cetirizine	Zyrtec	Histamine H_1-receptor antagonist Soluble in water.	Treatment of seasonal allergies and hives	
4	Fexofenadine	Carboxyterfenadine; Allegra; Telfast	Histamine H_1-receptor antagonist Soluble in DMSO (50 mM) and methanol.	Treatment of allergic rhinitis	
5	Fluticasone	Flovent (as propanoate); Flonase (as propanoate); Advair (with salmeterol)	Anti-inflammatory glucocorticoid Soluble in DMSO (≥10 mg/mL).	Treatment of asthma & rhinitis	
6	Loratadine	Claritin; Claratyne; Alavert	Long-acting antihistamine *mp 132 °C* Soluble in DMSO (50 mg/mL), ethanol (77 mg/mL at 25 °C), water (<1 mg/mL at 25 °C), chloroform, and methanol.	Relief of allergy symptoms	

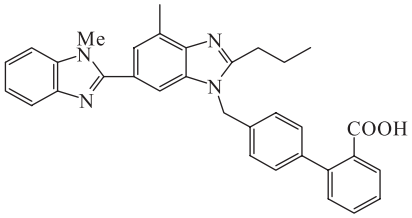
	Generic name	Trade names	Category and properties	Applications	Structure
7	Montelukast	Singulair	Leukotriene LTD_4 receptor antagonist Soluble in ethanol (100 mM), DMSO (100 mM), methanol, water (>100 mg/mL at 25 °C), and DMF (~30 mg/mL).	Control of asthma and relief of seasonal allergies	
8	Salmeterol	Serevent	β_2-Adrenergic receptor agonist Soluble in ethanol (50 mM) and DMSO (100 mM).	Treatment of asthma & chronic obstructive pulmonary disease	
9	Tiotropium bromide	Spiriva	Long-acting antimuscarinic bronchodilator Soluble in DMSO and methanol.	Treatment of chronic obstructive pulmonary disease	
Antibiotics					
10	Amikacin	Amikin; Biclin; Chemacin; Flexilite; Negasin	Aminoglycoside antibiotic Soluble in water (50 mg/mL), DMSO (<1 mg/mL at 25 °C), and ethanol (<1 mg/mL at 25 °C). Insoluble in acetone.	Treatment of serious infections resistant to other antibiotics	
11	Amoxicillin	Amoxil; Isimoxin; Ospamox	β-Lactam/penicillin Soluble in water.	Treatment of a broad spectrum of bacterial infections	
12	Azithromycin	Zithromax; Vinzam; Zmax; Azitrocin	Azalide/macrolide antibiotic *mp 114 °C* Soluble in DMSO (100 mg/mL at 25 °C), ethanol (100 mg/mL at 25 °C), water (<1 mg/mL at 25 °C), DMF (16 mg/mL), and ethanol:PBS(1:1 pH 7.2) (~0.5 mg/mL).	Treatment of bacterial skin, ear, and respiratory infections	
13	Cefaclor	Ceclor; Kefolar; Panacef; Panoral	β-Lactam/cephalosporin Soluble in water (1:100) and 1 N HCl (50 mg/mL).	Treatment of bacterial infections, pneumonia, and urinary tract infections	
14	Ciprofloxacin	Cipro; Ciproxin; Ciprobay; Flociprin; Uniflox	Fluoroquinoline/broad-spectrum antibiotic *mp 256 °C* Soluble in DMSO.	Treatment of urinary & respiratory tract infections, anthrax, and sexually transmitted diseases	

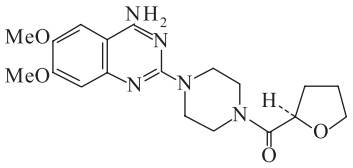
	Generic name	Trade names	Category and properties	Applications	Structure
15	Doxycycline	Vibramycin; Adoxa; Doryx; Liviatin; Deoxymykoin	Tetracycline/broad-spectrum antibiotic Soluble in water (50 mg/mL), DMSO (~1 mg/mL), methanol (1:4), and alcohol (1:60).	Treatment of urinary tract, respiratory tract, and eye infections; anthrax, syphilis, cholera, etc.	
16	Erythromycin	E-Mycin; Erythrocin; Ilosone	Macrolide antibiotic *mp 191 °C* Soluble in 2 M HCl (50 mg/mL), ethanol, water (50 mg/mL), methanol, and chloroform.	Treatment of bacterial infections, including diphtheria, pertussis, rheumatic fever, venereal disease, etc.	
17	Isoniazid	Laniazid	Antimycobacterial agent *mp 171 °C* Soluble in water (50 mg/mL), ethanol (27 mg/mL at 25 °C), DMSO (27 mg/mL at 25 °C), and methanol.	Treatment of tuberculosis; reduction of tremors from multiple sclerosis	
18	Linezolid	Zyvox	Oxazolidinone *mp 182 °C* Soluble in water (<1 mg/mL at 25 °C), ethanol (8 mg/mL at 25 °C), chloroform, methanol, and DMSO (68 mg/mL at 25 °C).	Treatment of serious Gram-positive infections resistant to other antibiotics	
19	Trimethoprim	Triprim; Proloprim; Monotrim	Dihydrofolate reductase inhibitor *mp 191 °C* Soluble in water (0.4 mg/mL), ethanol (2.6 mg/mL at 20 °C), methanol (12.1 mg/mL), chloroform (22.2 mg/mL at 20 °C), and DMSO (50 mg/mL).	Treatment of urinary tract infections, diarrhea, and ear infections	
Antidiabetic drugs					
20	Glipizide	Glucotrol; Glydiazinamide; Glibenese; Minodiab	Potassium channel blocker/ sulfonylurea *mp 208 °C* Soluble in water, chloroform, DMF, DMSO (48 mg/mL), and methanol.	Treatment of type 2 diabetes by stimulating insulin secretion in pancreas β-cells	
21	Metformin	Glucophage; Diabex; Diaformin; Fortamet	Antidiabetic biguanide Soluble in DMSO and methanol.	Treatment of type 2 diabetes by enhancing transport of glucose into muscle cells	
22	Pioglitazone	Actos	Peroxisome proliferator-activated receptor *mp 174 °C* Soluble in water (<1 mg/mL at 25 °C), DMF, methanol, ethanol (4 mg/mL at 25 °C), and DMSO (79 mg/mL at 25 °C).	Treatment of type 2 diabetes by increasing glucose metabolism and insulin sensitivity	
23	Rosiglitazone	Avandia	Thiazolidinedione Soluble in water (slightly), ethanol (2 mg/mL at 25 °C), DMSO (100 mg/mL), DMF (~10 mg/mL), and methanol.	Treatment of type 2 diabetes by increasing insulin sensitivity. Possible adverse effects on patients with heart problems.	

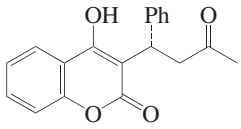
	Generic name	Trade names	Category and properties	Applications	Structure
24	Sitagliptin	Januvia	Dipeptidyl peptidase IV inhibitor Soluble in water and methanol.	Treatment of type 2 diabetes by enhancing the body's ability to lower elevated glucose levels	
Anti-inflammatory agents					
25	Acetylsalicylic acid	Aspirin; ASA	NSAID Slightly soluble in water, chloroform, DMSO, and methanol.	Pain and fever relief; anticlotting agent	
26	Celecoxib	Celebrex; Onsenal	NSAID (COX-2 inhibitor) *mp158 °C* Soluble in DMSO (76 mg/mL at 25 °C), methanol, ethanol (33 mg/mL at 25 °C), water (<1 mg/mL at 25 °C), and dichloromethane.	Treatment of osteoarthritis and rheumatoid arthritis	
27	Ibuprofen	Advil	NSAID (cyclooxygenase inhibitor) *mp 76 °C* Soluble in ethanol (25 mg/mL), chloroform (1:1), ether (1:2), acetone (1:1.5), aqueous solutions of alkali hydroxides and carbonates, dichloromethane, methanol (50 mg/mL), and ethyl acetate.	Relief of inflammation and pain	
28	Meloxicam	Mobic; Metacam; Metacain	NSAID (cyclooxygenase inhibitor) *mp 254 °C* Soluble in DMSO and water.	Treatment of osteoarthritis and rheumatoid arthritis	
29	Naproxen	Aleve; Naprelan; Anaprox; Naprogesic	NSAID *mp 155 °C* Soluble in water (22 mg/mL), DMSO (25 mg/mL), DMF, acetone(slightly soluble), ethanol(slightly soluble), and methanol(slightly soluble).	Relief of inflammation and pain	
30	Prednisone	Meticorten; Deltasone	Adrenocortical steroid; anti-inflammatory agent; immunosuppressant Soluble to 50 mg/mL in ethanol:chloroform (1:1), and in water (slightly).	Treatment of asthma and other inflammatory diseases	
Anti-ulcer drugs					
31	Cimetidine	Tagamet; Cimetimax; Gastromet; Peptimax	Histamine H_2-receptor antagonist *mp 142 °C* Soluble in DMSO, methanol, and water.	Treatment of peptic ulcer, gastrointestinal bleeding, and gastroesophageal reflux disease	
32	Lansoprazole	Prevacid; SoluTab; Prevpac; Zoton; Prezal	Proton pump inhibitor *mp 180 °C* Soluble in DMF and methanol.	Treatment of duodenal ulcers & gastroesophageal reflux disease	

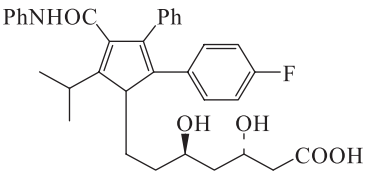
	Generic name	Trade names	Category and properties	Applications	Structure
33	Omeprazole	Prilosec; Nexium (Mg salt); Losec; Mepral; Mopral; Zoltum	Proton pump inhibitor *mp 156 °C* Soluble in acetonitrile, DMSO, and ethanol.	Treatment of peptic ulcer, dyspepsia, and gastroesophageal reflux disease	
34	Pantoprazole	Protonix; Pantozol; Rifun	Proton pump inhibitor Soluble in methanol.	Treatment of gastric acid-related conditions	
35	Ranitidine	Zantac; Azantac; Melfax; Rantec; Sostril; Taural	Histamine H_2-receptor antagonist *mp 70 °C* Soluble in water.	Treatment of peptic ulcer, gastrointestinal bleeding, and gastroesophageal reflux disease	
	Antiviral and antifungal agents				
36	Acyclovir	Zovirax; Zovir; Avirax; Mirolex	Viral DNA synthesis inhibitor *mp 225 °C* Soluble in water (sparingly), DMSO (50 mg/mL), DMF (1 mg/mL), 1eq. HCl (50 mM), and dilute alkalies.	Treatment of cold sores, genital herpes, chicken pox, etc.	
37	Amphotericin	Fungizone; Amfostet; Amphozone	Polyene macrolide antifungal agent *mp 170 °C* Soluble in DMSO (30-40 mg/mL), acidic water (pH 2) or basic water (pH 11) (~0.1 mg/mL), DMF (2-4 mg/mL), DMF + 1 M HCl (3:1) (60-80 mg/mL), and methanol (slightly). Insoluble in ether.	Intravenous treatment of systemic fungal infections	
38	Efavirenz	Sustiva	Non-nucleoside HIV reverse transcriptase inhibitor *mp 131 °C* Soluble in methanol.	Treatment of HIV-1 infections (as part of combination therapy)	
39	Fluconazole	Diflucan; Biozolene; Elazor; Triflucan	Cytochrome P450 14α-demethylase inhibitor *mp 139 °C* Soluble in water (<1 mg/mL at 25 °C), ethanol (61 mg/mL at 25 °C), and DMSO (61 mg/mL at 25 °C).	Treatment and prevention of superficial & systemic fungal infections	
40	Lamivudine	Epivir; Heptodin; Zeffix	HIV reverse transcriptase inhibitor Soluble in water (46 mg/mL at 25 °C), DMSO (46 mg/mL at 25 °C), methanol, and ethanol (<1 mg/mL at 25 °C).	Treatment of hepatitis B and human immunodeficiency virus	

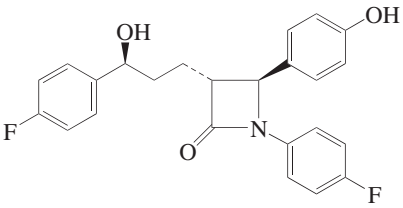
	Generic name	Trade names	Category and properties	Applications	Structure
41	Nevirapine	Viramune	Non-nucleoside HIV reverse transcriptase inhibitor *mp 250 °C* Soluble in chloroform and methanol.	Treatment of HIV infections (as part of combination therapy)	
42	Oseltamivir	Tamiflu	Neuraminidase inhibitor *Foam* Soluble in methanol and water.	Prevention & treatment of influenza A and B	
43	Ribavirin	Virazole; Rebetol; Copegus; Ribasphere; Viratek; Cotronak	Nucleoside antimetabolite *mp 175 °C* Soluble in water (20 mg/mL), DMSO (49 mg/mL at 25 °C), ethanol (<1 mg/mL at 25 °C).	Treatment of hepatitis C	
44	Terbinafine	Lamisil	Squalene epoxidase inhibitor Soluble in DMSO (≥58 mg/mL) at 25 °C, water (<1 mg/mL) at 25 °C, and ethanol (≥58 mg/mL) at 25 °C.	Treatment of fungal infections of the skin & nails	
45	Zalcitabine	Hivid	Pyrimidine nucleoside reverse transcriptase inhibitor Soluble in water (76.4 mg/mL at 25 °C), DMSO (42 mg/mL at 25 °C), and ethanol (<1 mg/mL at 25 °C).	Treatment of HIV infection & AIDS	
46	Zidovudine	Retrovir; AZT; Azidothymidine; Zidovir	Pyrimidine nucleoside reverse transcriptase inhibitor *mp 121 °C* Soluble in water (50 mg/mL), DMSO, and methanol.	Treatment of HIV infection & prevention of mother-to-child transmission	

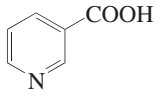


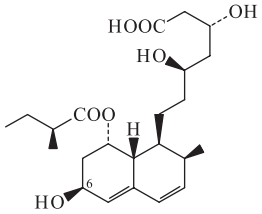


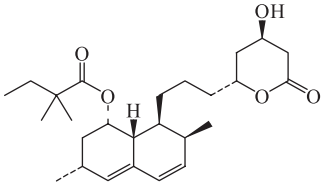


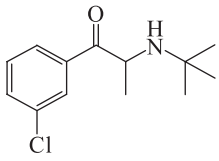




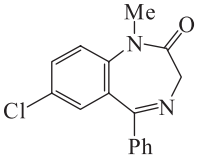


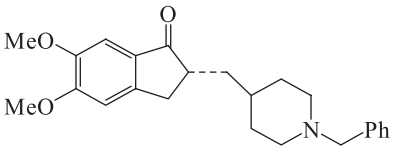


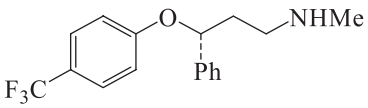


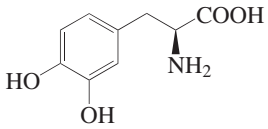


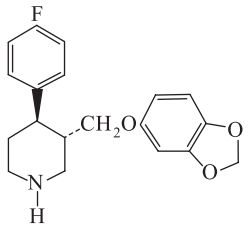
Cancer chemotherapy drugs

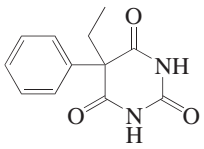


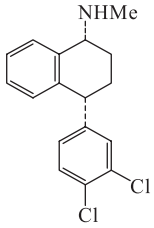


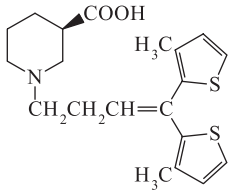


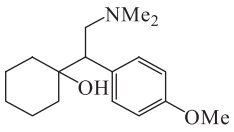


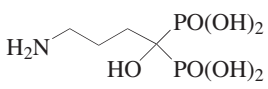












47	Anastrozole	Arimidex	Aromatase inhibitor; antineoplastic agent *mp 81 °C* Soluble in chloroform, methanol, ethanol (59 mg/mL at 25 °C), DMSO (59 mg/mL at 25 °C), and DMF (~14 mg/mL).	Treatment of breast cancer in postmenopausal women	
48	Bicalutamide	Casodex	Antiandrogen *mp 180 °C* Soluble in DMSO (86 mg/mL at 25 °C), DMF (~20 mg/mL), ethanol (7 mg/mL at 25 °C), and methanol (slightly). Insoluble in water.	Treatment of advanced prostate cancer	

	Generic name	Trade names	Category and properties	Applications	Structure
49	Bortezomib	Velcade	Proteasome inhibitor Soluble in chloroform, DMSO (200 mg/mL), ethanol (200 mg/mL), and methanol.	Treatment of lymphomas and multiple myeloma	
50	Capecitabine	Xeloda	Antimetabolite Soluble in water (26 mg/mL), ethanol (207 mg/mL), methanol (> 40%), DMF (~14 mg/mL), and DMSO (72 mg/mL at 25 °C).	Treatment of breast & colon cancer	
51	Carboplatin	Paraplatin; Carboplat; Erbakar; Nonoplat	Platinum-based anticancer agent Soluble in water (10 mg/mL), saline, DMSO (<1 mg/mL), and ethanol (<1 mg/mL).	Treatment of ovarian cancer	
52	Cyclo~-phosphamide	Cytoxan; Neosar; Cytophosphan; Endoxan; Clafen	Oxazaphosphorine alkylating agent ("Nitrogen mustard") *mp 143 °C* Soluble in water (100 mM), DMSO (100 mM), and ethanol (52 mg/mL) at 25 °C.	Treatment of lymphomas & leukemias, multiple myeloma, and other cancers	
53	Docetaxel	Taxotere	Antineoplastic agent *mp 232 °C* Soluble in chloroform, dichloromethane, DMSO, ethyl acetate, methanol, and ethanol (25 mg/mL).	Treatment of ovarian, breast, and bronchial carcinomas	
54	Fluorouracil	Efudex; Carac; Fluoroplex; Adrucil	Thymidylate synthesis inhibitor *mp 243 °C* Soluble in DMF (5 mg/mL), DMSO (5 mg/mL), methanol (1 mg/mL), hot water (1 mg/mL), 1 N NH_4OH (50 mg/mL), 1M NaOH, ethanol (10 mM), and water (12.2 g/l) at 20 °C.	Constituent of several antineoplastic combinations	
55	Gemcitabine	Gemzar (as hydrochloride)	Antineoplastic and antiviral agent *mp 290 °C* Soluble in water (100 mM), methanol (slightly), DMSO (50 mM), and acetone. Insoluble in ethanol.	Treatment of lung and pancreatic tumors	
56	Imatinib	Gleevec; Glivec	Protein kinase inhibitor *mp 212 °C* Soluble in water (<1 mg/mL at 25 °C), ethanol (<1 mg/mL at 25 °C), and DMSO (3 mg/mL at 25 °C).	Treatment of myelogenous leukemia and gastrointestinal tumors	

	Generic name	Trade names	Category and properties	Applications	Structure
57	Irinotecan	Camptosar; Camptetin; Topotecin	Topoisomerase I inhibitor Soluble in water and methanol.	Treatment of colorectal cancer	
58	Paclitaxel	Taxol; Abraxane; Yewtaxan	Microtubule-stabilizing agent *mp 214 °C* Soluble in methanol.	Treatment of ovarian, breast, and lung cancer	
59	Sunitinib	Sutent	Tyrosine kineases inhibitor Soluble in water (>25 mg/mL, pH 1.2-6.8), DMSO (>10 mg/mL), and methanol.	Treatment of gastrointestinal & kidney tumors	
60	Tamoxifen	Nolvadex; Soltamox; Tamaxin; Tamoplex; Valodex	Selective estrogen receptor modulator *mp 97 °C* Soluble in dichloromethane	Treatment of breast cancer	
Cardiovascular agents					
61	Aliskiren	Tekturna; Rasilex	Renin inhibitor Soluble in methanol, chloroform, and water.	Treatment of hypertension	
62	Amlodipine	Norvasc	Calcium channel blocker Soluble in DMSO (25 mg/mL), ethanol (25 mg/mL), water (75.3 mg/mL), DMF (25 mg/mL), acetone, chloroform, ethyl acetate, and methanol.	Treatment of hypertension, atrial fibrillation, and angina	
63	Atenolol	Tenormin	β-blocker *mp 147 °C* Soluble in water (25 mM), DMSO (18 mg/mL), ethanol (3.4 mg/mL), methanol (50 mg/mL), and water (26.5 mg/mL at 37 °C).	Treatment of hypertension and excessive heart rate	
64	Carvedilol	Coreg; Dilatrend; Eucardic	Calcium channel blocker; β-adrenoceptor blocker Soluble in DMSO (>25 mg/mL), ethanol (10 mg/mL), methanol (33.8 mg/mL), phosphate buffer (pH 4) (0.43 mg/mL) at 37 °C, water (slightly), chloroform, methylene chloride, and ethyl ether (slightly).	Treatment of heart failure and hypertension	
65	Clopidogrel	Plavix; Isocover; Meilax; Tipidyl	Antiplatelet agent Soluble in DMSO.	Prevention of blood clots after stroke or myocardial infarction	

	Generic name	Trade names	Category and properties	Applications	Structure
66	Digoxin	Lanoxin; Davoxin; Digacin; Dilanacin; Rougoxin; Digosin; Cordioxil	Cardiac glycoside *mp 249 °C* Soluble in chloroform, DMSO, methanol, pyridine (50 mg/mL), diluted ethanol, and mixture of chloroform and alcohol. Insoluble in water (64.8 mg/L 25°C), ether, acetone, and ethyl acetate.	Treatment of congestive heart failure	
67	Enalaprilat	Vasotec	Angiotensin-converting enzyme inhibitor; antihypertensive agent *mp 150 °C* Slightly soluble in water.	Treatment of hypertension, atherosclerosis, and congestive heart failure	
68	Glycerol trinitrate	Nitroglycerin	Cardiac stimulant and vasodilator Soluble in acetone, ether, benzene, ethanol, and water (slightly).	Treatment of angina and congestive heart failure	
69	Irbesartan	Aprovel; Avapro; Avalide (in combination with hydrochloro-thiazide)	Angiotensin II AT_1-receptor antagonist *mp 180 °C* Soluble in DMSO (>25 mg/mL), ethanol (~0.5 mg/mL), methanol, DMF (~20 mg/mL), and water (<1 mg/mL at 25 °C).	Treatment of hypertension and diabetes-related kidney disease	
70	Lisinopril	Acecomb; Alapril; Carace; Novatec; Novazyd; Vivatec; Zestoretic; Zestril	Angiotensin-converting enzyme inhibitor; antihypertensive agent *mp 159 °C* Soluble in PBS (1 mg/mL, pH 7.2), ethanol (sparingly), DMSO (sparingly), and DMF (sparingly).	Treatment of hypertension	
71	Losartan	Cozaar; Hyzaar (with hydrochloro-thiazide)	Angiotensin II AT_1-receptor antagonist *mp 184 °C* Soluble in ethanol (100 mM) and DMSO (100 mM).	Treatment of congestive heart failure and hypertension	
72	Metoprolol	Lopressor; Toprol XL	β-Adrenergic blocker Soluble in methanol and water.	Treatment of angina and hypertension	

	Generic name	Trade names	Category and properties	Applications	Structure
73	Telmisartan	Micardis	Angiotensin II (AT_1) receptor antagonist *mp 262 °C* Soluble in DMSO (13 mg/mL at 25 °C), chloroform, DMF (~1.6 mg/mL), and ethanol (<1 mg/mL at 25 °C). Insoluble in water.	Treatment of hypertension	
74	Terazosin	Hytrin; Itrin; Hytrinex; Magnurol; Teraprost; Vasocard; Uroflo; etc.	Antihypertensive agent (α_1-adrenoceptor antagonist) Soluble to 50 mM in water.	Treatment of hypertension and benign prostatic hyperplasia	
75	Warfarin	Coumadin	Anticlotting agent *mp 161 °C* Soluble in dioxane and acetone.	Reduction of possibility of stroke or coronary	
Cholesterol-lowering drugs					
76	Atorvastatin	Lipitor; Caduet (in combination with amlodipine)	HMG-CoA reductase inhibitor (statin) Soluble in methanol.	Reduction of LDL cholesterol levels by inhibiting cholesterol biosynthesis	
77	Ezetimibe	Zetia	Selective cholesterol absorption inhibitor *mp 165 °C* Soluble in water (<1 mg/mL at 25 °C), DMSO (82 mg/mL at 25 °C), ethanol (82 mg/mL at 25 °C), and methanol.	Reduction of LDL cholesterol levels by inhibiting dietary cholesterol absorption	
78	Nicotinic acid	Niacin	Lipoprotein synthesis inhibitor Soluble in water (15 g/l at 20 °C), alkali hydroxides, propylene glycol, water (150 g/l at 100 °C), ethanol (12.5 g/l at 25 °C), DMSO (25 mg/mL), methanol, carbonates, and water (15 g/l at 20 °C). Insoluble in diethyl ether.	Reduction of LDL cholesterol levels	
79	Pravastatin	Pravochol	HMG-CoA reductase inhibitor (statin) Soluble in non-polar solvents.	Reduction of LDL cholesterol levels by inhibiting cholesterol biosynthesis	
80	Simvastatin	Zocor; Vytorin (combination with Ezetimibe)	HMG-CoA reductase inhibitor (statin) *mp 136 °C* Soluble in DMSO (>25 mg/mL), ethanol (>25 mg/mL), water (0.03 mg/l), and methanol.	Reduction of LDL cholesterol levels by inhibiting cholesterol biosynthesis	
Depression and anxiety drugs					
81	Bupropion	Wellbutrin; Amfebutamone; Zyban	Dopamine reuptake inhibitor *Pale yellow oil* Soluble in water (>25 mg/mL), ethanol 193 mg/mL, and 0.1 N HCl 333 mg/mL.	Antidepressant; smoking cessation aid	

	Generic name	Trade names	Category and properties	Applications	Structure
82	Diazepam	Valium; Stesolid; Seduxen; Antenex; Calmpose; Livotensin	Benzodiazepine central nervous system depressant *mp 125 °C* Soluble in DMF and ethanol, slightly soluble in water.	Treatment of anxiety, seizures, muscular spasms, and insomnia	
83	Donepezil	Aricept	Acetylcholine esterase inhibitor Soluble in chloroform (~50 mg/mL) and acetone (~25 mg/mL).	Treatment of Alzheimer's disease	
84	Fluoxetine	Prozac; Sarafem; Adofen; Fontex; Lorien	Selective serotonin reuptake inhibitor Soluble in water (4 mg/mL), DMSO (>5 mg/mL), acetone, acetonitrile, chloroform,	Treatment of depression, panic attacks, and obsessive-compulsive disorder	
85	Levodopa	L-Dopa; Larodopa; Bendopa; Veldopa	Precursor to the neurotransmitter dopamine *mp 277 °C* Soluble in water (66 mg/mL), DMSO (<1 mg/mL at 25 °C), and 0.5 M HCl (50 mg/mL). Insoluble in ethanol, and chloroform.	Treatment of Parkinson's disease	
86	Paroxetine	Paxil; Seroxat; Tagonis; Aropax; Motivan	Selective serotonin reuptake inhibitor Soluble in DMSO (25 mg/mL), chloroform, and methanol. Insoluble in water.	Treatment of depression, panic attacks, and obsessive-compulsive disorder	
87	Phenobarbital	Luminal; Fenemal; Gardenal; Barbivis	Anticonvulsant *mp 174 °C*	Epilepsy control; also used as a sedative	
88	Sertraline	Zoloft; Lustral; Serad; Serlain; Tatig	Selective serotonin reuptake inhibitor Soluble in DMSO (>25 mg/mL), ethanol (10 mg/mL), water (3 mg/mL), 0.1 N HCl (0.51 mg/mL), isopropyl alcohol (4.3 mg/mL), chloroform (110 mg/mL), and dimethylsulfoxide (147 mg/mL).	Treatment of depression, panic attacks, and obsessive-compulsive disorder	
89	Tiagabine	Gabitril	GABA reuptake inhibitor; anticonvulsant Soluble in water.	Treatment of epileptic seizures	
90	Venlafaxine	Effexor; Trewilor; Vandral; Dobupal	Selective serotonin & norepinephrine reuptake inhibitor Soluble in dichloromethane, ethyl acetate, and methanol.	Treatment of anxiety and panic disorders	
Osteoporosis drugs					
91	Alendronic acid	Fosamax; Adronat; Alendros; Dronal	Farnesyl pyrophosphate synthase inhibitor Soluble in water (40 g/l) at 25 °C and PBS (pH 7.2) (~0.25 mg/mL).	Prevention and treatment of osteoporosis and Paget's disease	

	Generic name	Trade names	Category and properties	Applications	Structure
92	Calcitriol	Rocaltrol; Calcijex	Calcium and phosphate metabolism regulator *mp 170 °C*	Treatment of rickets and osteoporosis	
93	Raloxifene	Evista (as hydrochloride)	Selective estrogen receptor modulator Soluble in DMSO (50 mM), methanol, and ethanol (<1 mg/mL at 25 °C). Insoluble in water.	Prevention and treatment of osteoporosis	
94	Risedronic acid	Actonel (as Na salt); Optinate	Calcium regulator Soluble in water (<1 mg/mL at 25 °C), ethanol (<1 mg/mL at 25 °C), and DMSO (<1 mg/mL at 25 °C).	Treatment of osteoporosis & Paget's disease	
Pain relief drugs					
95	Acetaminophen	Tylenol; APAP; Paracetamol; Hedrex; Tramil	Analgesic/antipyretic *mp 170 °C* Soluble in water (14 g/l at 20 °C), ethanol (100 mM), DMSO (100 mM), methanol (50 mg/mL), and DMF.	Relief of musculoskeletal, neuralgic, and other types of pain	
96	Fentanyl	Duragesic; Actiq; Fentora; Sublimaze	Opioid μ-receptor agonist *mp 875 °C*	Treatment of severe pain; spinal and epidural anesthesia	
97	Gabapentin	Neurotin; Aclonium	Anticonvulsant/analgesic; CNS depressant *mp 164 °C* Soluble in water (10 mg/mL), PBS pH 7.2 (~10 mg/mL), methanol, ethanol (sparingly), DMSO (sparingly), and DMF (sparingly).	Treatment of neuralgia, pain from shingles, migraine, and epilepsy	
98	Lidocaine	Xylocaine; Xylocard; Lidamantle	Aminoamide anesthetic/ antiarrhythmic agent	Local anesthetic for dental procedures	
99	Morphine	Avinza; Contin; Kadian; Roxanol; Meconium; Morfine	Opioid analgesic *mp 255 °C* Soluble in water (64 mg/mL) and ethanol (1.8 mg/mL).	Pain management, especially in malignant diseases	
100	Thiopental	Pentothal; Penthiobarbital; Thiopentone	Short-acting barbiturate/anesthetic	Induction of presurgical anesthesia	

	Generic name	Trade names	Category and properties	Applications	Structure
101	Sumatriptan	Imitrex; Imigrane; Megrelan; Permicran; Sumadol	Selective 5-HT_{1D} receptor agonist Soluble in water (83 mg/mL), DMSO (83 mg/mL), and methanol (very slightly). Insoluble in ethanol, and ether.	Treatment of severe migraine headaches	
	Reproductive and urinary system drugs				
102	Finasteride	Proscar; Propecia; Andozac; Finastid; Procure; Urprosan	5α Reductase inhibitor *mp 252 °C* Soluble in water (0.05 mg/mL), DMSO (75 mg/mL at 25 °C), ethanol (75 mg/mL), methanol, and chloroform.	Treatment of benign prostatic hyperplasia and male hair loss	
103	Mestranol	Devocin; Norinyl; Ovastol; Tranel	Estrogen, used in combination as oral contraceptive *mp 151 °C* Soluble in DMSO (15 mg/mL at 25 °C), water (<1 mg/mL at 25 °C), and ethanol (25 mg/mL at 25 °C).	Prevention of unplanned pregnancy	
104	Mifepristone	Mifeprex; Mifegyne; Corlux; RU 486	Progesterone receptor modulator *mp 150 °C* Soluble in water (slightly), DMF (~30 mg/mL), ethanol (50 mg/mL), methanol, and DMSO (86 mg/mL at 25 °C).	Termination of pregnancy	
105	Sildenafil	Viagra; Revatio	Cyclic GMP phosphodiesterase inhibitor Soluble in water (3.5 mg/mL), DMSO (23 mg/mL at 25 °C), ethanol (<1 mg/mL at 25 °C), methanol, and DMF (~14 mg/mL).	Treatment of erectile dysfunction and pulmonary hypertension	
106	Tamsulosin	Flomax; Amsulosin; Harnal; Omix	Prostate selective α_1-adrenoceptor antagonist Soluble in DMSO (100 mM), methanol, and water (10 mM).	Treatment of benign prostatic hyperplasia	
107	Testosterone	Androderm; Androgel; Testrim; Striant	Anabolic steroid hormone Freely soluble in dehydrated alcohol and chloroform. Insoluble in water.	Treatment of male hypogonadism	

Index to Trade and Generic Names

The index below lists the trade and generic names for the drugs in this table; the generic names are in bold face. Each entry is referred to by its generic name and the identification number in the table. An asterisk* beside the trade name indicates a product that is a combination of two drugs.

Name	Generic Name
Abraxane	Paclitaxel (58)
Acecomb	Lisinopril (70)
Acetaminophen	Acetaminophen (95)
Acetylsalicylic acid	Acetylsalicylic acid (25)
Aclonium	Gabapentin (97)
Actiq	Fentanyl (96)
Actonel	Risedronic acid (94)
Actos	Pioglitazone (22)
Acyclovir	Acyclovir (36)
Adofen	Fluoxetine (84)
Adoxa	Doxycycline (15)
Adronat	Alendronic acid (91)
Adrucil	Fluorouracil (54)
Advair*	Fluticasone (5)
Advil	Ibuprofen (27)
Alapril	Lisinopril (70)
Alavert	Loratadine (6)
Albuterol	Albuterol (1)
Alendronic acid	Alendronic acid (91)
Alendros	Alendronic acid (91)
Aleve	Naproxen (29)

Name	Generic Name
Aliskiren	Aliskiren (61)
Allegra	Fexofenadine (4)
Amfebutamone	Bupropion (81)
Amfostet	Amphotericin (37)
Amikacin	Amikacin (10)
Amikin	Amikacin (10)
Amlodipine	Amlodipine (62)
Amoxicillin	Amoxicillin (11)
Amoxil	Amoxicillin (11)
Amphotericin	Amphotericin (37)
Amphozone	Amphotericin (37)
Amsulosin	Tamsulosin (106)
Anaprox	Naproxen (29)
Anastrozole	Anastrozole (47)
Andozac	Finasteride (102)
Androderm	Testosterone (107)
Androgel	Testosterone (107)
Antenex	Diazepam (82)
APAP	Acetaminophen (95)
Aprovel	Irbesartan (69)
Aricept	Donepezil (83)
Arimidex	Anastrozole (47)
Aropax	Paroxetine (86)
Aspirin	Acetylsalicylic acid (25)
Atenolol	Atenolol (63)
Atorvastatin	Atorvastatin (76)
Avalide*	Irbesartan (69)
Avandia	Rosiglitazone (23)
Avapro	Irbesartan (69)
Avinza	Morphine (99)
Avirax	Acyclovir (36)
Azantac	Ranitidine (35)
Azidothymidine	Zidovudine (46)
Azithromycin	Azithromycin (12)
Azitrocin	Azithromycin (12)
AZT	Zidovudine (46)
Barbivis	Phenobarbital (87)
Bendopa	Levodopa (85)
Bicalutamide	Bicalutamide (48)
Biclin	Amikacin (10)
Biozolene	Fluconazole (39)
Bortezomib	Bortezomib (49)
Budamax	Budesonide (2)
Budeson	Budesonide (2)
Budesonide	Budesonide (2)
Bupropion	Bupropion (81)
Caduet*	Atorvastatin (76)
Calcijex	Calcitriol (92)
Calcitriol	Calcitriol (92)
Calmpose	Diazepam (82)
Camptetin	Irinotecan (57)
Camptosar	Irinotecan (57)
Capecitabine	Capecitabine (50)
Carac	Fluorouracil (54)
Carace	Lisinopril (70)
Carboplat	Carboplatin (51)
Carboplatin	Carboplatin (51)
Carboxyterfenadine	Fexofenadine (4)
Carvedilol	Carvedilol (64)
Casodex	Bicalutamide (48)
Ceclor	Cefaclor (13)

Name	Generic Name
Cefaclor	Cefaclor (13)
Celebrex	Celecoxib (26)
Celecoxib	Celecoxib (26)
Cetirizine	Cetirizine (3)
Chemacin	Amikacin (10)
Cimetidine	Cimetidine (31)
Cimetimax	Cimetidine (31)
Cipro	Ciprofloxacin (14)
Ciprobay	Ciprofloxacin (14)

Zovirax	Acyclovir (36)
Zyban	Bupropion (81)
Zyrtec	Cetirizine (3)
Zyvox	Linezolid (18)

CHEMICAL CONSTITUENTS OF HUMAN BLOOD

This table lists typical concentrations of some of the chemical constituents of human blood. The table covers elements and compounds of relatively low molecular weight. References 1 and 4 give extensive information on enzymes, hormones, vitamins, and other blood constituents.

The values given for the normal range refer to healthy adults who have not been exposed to unusual environmental agents. In keeping with IUPAC practice, all values refer to a volume of one liter, and thus are stated in units of g/L, mg/L, µg/L, or mmol/L. Many clinical test results, especially in the United States, are reported on a deciliter (dL) rather than a liter basis; thus the values in this table should be divided by 10 to place them on a dL basis. The symbols S (for serum), P (plasma), and WB (whole blood) in the second column indicate the nature of the blood sample to which the values apply. In some cases only a single mean value has been reported, rather than a range; these are given in italics.

The total volume of blood in a 100 kg (220 lb) adult is 7.5 L for a male and 6.7 L for a female. The corresponding volume of plasma is 4.4 L and 4.3 L, respectively (Reference 1).

Values from Reference 1 are so-called "reference values" against which clinical tests of blood chemistry are compared.The Lower limit and Upper limit define the "normal range", which is understood to include about 95% of the healthy population. The remaining 5% may show values outside the normal range without necessarily implying a medical problem. Note that these reference values may vary slightly from one testing laboratory to another, depending on the detailed test procedure.

Accurate measurements on trace elements are very difficult to make, and wide variations can be found in the literature. Preferred measurement methods are discussed in References 2 and 6. Values for the trace elements can also vary from one country to another, depending on dietary or environmental factors. Thus cadmium levels tend to be higher in Japan because of the prevalence of seafood in the diet, and lead levels are higher in regions where lead additives are still used in gasoline. Variations with gender, age, geography, and occurrence of diseases are reviewed in Reference 6.

The Critical values column gives levels that deviate far enough from the normal range to suggest a probable medical issue. Such values from Reference 3 are the Biological Exposure Indexes (BEI) that are specified by the American Council of Government Industrial Hygienists (ACGIH) as danger signals for the levels of pollutants in the workplace.

Uric acid (females)	S	mg/L	13	60		1
Valine	S,P	mg/L	24	37		4

* Measured as the percent of hemoglobin bound to CO. Typical value for heavy smokers is 5%–10%. Major symptoms begin around 30%, and respiratory failure sets in at >60%.

** This is the desirable upper limit. Values between 2000 and 2400 mg/L are considered borderline high.

CHEMICAL COMPOSITION OF THE HUMAN BODY

The elemental composition of the "standard man" of mass 70 kg is given below.

NUTRIENT VALUES OF FOODS

The U. S. Department of Agriculture maintains the USDA National Nutrient Database for Standard Reference, which contains over 7000 food items with data on the energy content, minerals, vitamins, and other properties of nutritional interest. The table here includes about 600 common foods extracted from that database. The properties listed are the energy content (in effect, the enthalpy of combustion); the content of carbohydrates, proteins, and lipids (fats); the cholesterol content; and the amount of sodium, potassium, calcium, magnesium, iron, copper, zinc, manganese, phosphorus, and selenium. All values are given for a 100 gram sample of the food.

To conform with common practice in nutritional science, the energy content is given in kilocalories. For conversion to kilojoules, this number should be multiplied by 4.184. For conversion to the avoirdupois units frequently used in the United States, note that:

1 oz = 28.35 g (thus the 100 g basis in this table is approximately 3.5 oz)
1 lb = 453.6 g

The full USDA database covers specific proprietary brands of many processed foods, and it includes vitamin content as well as the minerals given in this table.

Section 8
Analytical Chemistry

Abbreviations and Symbols Used in Analytical Chemistry 8-1
Basic Instrumental Techniques of Analytical Chemistry 8-6
Analytical Standardization and Calibration 8-10
Figures of Merit 8-16
Mass- and Volume-Based Concentration Units 8-17
Detection of Outliers in Measurements 8-18
Properties of Carrier Gases for Gas Chromatography 8-19
Common Symbols Used in Gas and Liquid Chromatographic Schematic Diagrams 8-20
Stationary Phases for Porous-Layer Open Tubular Columns 8-21
Coolants for Cryotrapping 8-22
Properties of Common Cross-Linked Silicone Stationary Phases 8-23
Detectors for Gas Chromatography 8-24
Varieties of Hyphenated Gas Chromatography with Mass Spectrometry 8-26
Solid-Phase Microextraction Sorbents 8-28
Gas Chromatographic Retention Indices 8-31
Eluotropic Values of Solvents on Octadecylsilane and Octylsilane 8-33
Instability of HPLC Solvents 8-34
Detectors for Liquid Chromatography 8-35
Solvents for Ultraviolet Spectrophotometry 8-36
Correlation Table for Ultraviolet Active Functionalities 8-37
Wavelength-Wavenumber Conversion Table 8-40
Middle-Range Infrared Absorption Correlation Charts 8-43
Common Spurious Infrared Absorption Bands 8-49
Nuclear Spins, Moments, and Other Data Related to NMR Spectroscopy 8-50
Properties of Important NMR Nuclei 8-53
Proton NMR Absorption of Major Chemical Families 8-54
Proton NMR Correlation Chart for Major Organic Functional Groups 8-60
Proton NMR Shifts of Common Organic Liquids 8-61
^{13}C-NMR Absorptions of Major Functional Groups 8-67
^{13}C-NMR Chemical Shifts of Common Organic Solvents 8-68
^{15}N-NMR Chemical Shifts of Major Chemical Families 8-69
Natural Abundance of Important Isotopes 8-71
Common Mass Spectral Fragmentation Patterns of Organic Compound Families 8-72
Common Mass Spectral Fragments Lost 8-74
Major Reference Masses in the Spectrum of Heptacosafluorotributylamine (Perfluorotributylamine) 8-75
Mass Spectral Peaks of Common Organic Liquids 8-76
Common Spurious Signals Observed in Mass Spectrometers 8-83
Chlorine–Bromine Combination Isotope Intensities 8-84
Reduction of Weighings in Air to Vacuo 8-85
Standards for Laboratory Weights 8-86
Indicators for Acids and Bases 8-88
Preparation of Special Analytical Reagents 8-89
Organic Analytical Reagents for the Determination of Inorganic Ions 8-94
Precipitation of Sulfides 8-107
pH Range for Precipitation of Metal Hydroxides and Oxides 8-108

This page intentionally left blank

ABBREVIATIONS AND SYMBOLS USED IN ANALYTICAL CHEMISTRY

Abbreviations Used in Analytical Chemistry

A: peak area; surface area of solid granular adsorbent; eddy diffusion term in the Van Deemter equation
AAA: absolute activation analysis
AAD: atomic absorption detector
AAS: atomic absorption spectroscopy
AC: alternating current, affinity chromatography
ACP: alternating current plasma
ADXPS: angular dependent x-ray photoelectron spectroscopy
AED: atomic emission detector
AEM: analytical electron microscope (microscopy)
AES: Auger electron spectroscopy, atomic emission spectroscopy
AFID: alkali flame ionization detector
AFM: atomic force microscopy
AFS: atomic force spectroscopy
AIS: average of individual samples
AL: action level
AM: amplitude modulation
AMS: accelerator mass spectrometry
AN: area normalization
ANRF: area normalization with response factors
AOTF: acousto-optical tunable filter
AP: analytical pyrolysis
APCI: atmospheric pressure chemical ionization
APD: azimuthal photoelectron diffraction
API: atmospheric pressure ionization
APSTM: analytical photon scanning tunneling microscope
APT: attached proton test
ARAES: angle resolved Auger electron spectroscopy
ARF: absolute response factor
ARM: atomic resolution microscopy
ARPES: angle resolved photoelectron spectroscopy
ARUPS: angle resolved ultraviolet photoelectron spectroscopy
ASE: accelerated solvent extraction
AsFIFFF (AF4): asymmetrical flow field flow fractionation
ATD: above-threshold dissociation
ATI: above-threshold ionization
ATR: attenuated total reflection
BB: band broadening
BE: magnetic sector – electric sector tandem mass spectrometer (note: also called a MIKE spectrometer)
BEE: magnetic sector – electric sector – electric sector mass spectrometer
BET: Brunauer-Emmett-Teller (adsorption isotherm)
BIFL: burst integrated fluorescence lifetime
BIS: Bremsstrahlung isochromat spectroscopy
BL: bioluminescence
BLRF: bispectral luminescence radiance factor
BQQ: magnetic sector-double quadrupole mass spectrometer BTOF
BTOF: magnetic sector – time of flight tandem mass spectrometer
CAD: collision activated dissociation
CAR: continuous addition of reagent
CARS: coherent anti-Stokes Raman spectroscopy
CCC: counter-current chromatography
CCD: charge-coupled device
CCT: constant current topography
CD: circular dichroism
CE: capillary electrophoresis, counter electrode
CEC: capillary electrokinetic chromatography, capillary electrochromatography
CED: cohesive energy density
CFA: continuous flow analysis
CF-FAB: continuous flow-fast atom bombardment
CFM: chemical force microscopy
CGE: capillary gel electrophoresis
CHEMFET: chemical-sensing field effect transistor
CI: chemical ionization
CID: collision induced dissociation
CIEF: capillary isoelectric focusing
CITP: capillary isotachophoresis
CL: chemiluminescence
CLLE: continuous liquid-liquid extraction
CMA: cylindrical mirror analyzer
COSY: correlation spectroscopy
CPAA: charged particle activation analysis
CP/MAS: cross polarization/magic angle spinning
CRDS: cavity ring-down spectroscopy
CRF: chromatographic response function
CRM: certified reference material
CT: cryogenic trapping
CTD: charge transfer device
CV: cyclic voltammetry
CV-ASS: cold vapor atomic absorption spectrometry
CVD: chemical vapor deposition
CW: continuous wave
CZE: capillary zone electrophoresis
DA: diode array
DAD: diode array detector (UV-Vis)
DADI: direct analysis of daughter ions
DBE: double bond equivalent
DC: direct current
DCI: desorption chemical ionization
DCP: direct-current plasma
DEP: differential electrolytic potentiometry
DEPT: distortionless enhancement by polarization transfer
DETA: dielectric thermal analysis
DIN: direct injection nebulizer
DLI: direct liquid introduction
DLS: dynamic light scattering
DMA: dynamic mechanical analysis
DME: dropping mercury electrode
DNMR: dynamic nuclear magnetic resonance
DPP: differential pulse polarography
DRIFT: diffuse-reflectance infrared Fourier transform
DSC: differential scanning calorimetry
DTA: differential thermal analysis
DTC: differential thermal calorimetry
EAES: electron-excited Auger electron spectroscopy
EB: electric sector – magnetic sector tandem mass spectrometer
EBE: electric sector – magnetic sector-electric sector tandem mass spectrometer
EC: electrochemical
ECD: electron capture detector

ECMS: electron capture mass spectrometry
ECNIMS: electron capture negative ionization mass spectrometry
EDL: electrodeless discharge lamp
EDS: energy-dispersive spectrometer
EDXRF: energy-dispersive x-ray fluorescence
EELS: electron energy-loss spectroscopy
EFFF: electric field flow fractionation
EGA: evolved gas analysis
EIA: enzyme-linked immunoassay
EI(I): electron impact (ionization)
EIMS: electron impact mass spectrometry
ELCD: electrolytic conductivity detector
ELISA: enzyme-linked immunosorbent assay
ELSD: evaporative light scattering detector
EM: electron microscopy
EMIRS: electrochemically modulated IR spectroscopy
EOF: electro-osmotic flow
EPL: enhanced photoactivated luminescence
EPMA: electron-probe microanalysis
EPR: electron paramagnetic resonance
EPXMA: electron-probe x-ray microanalysis
EQL: estimated quantitation limit
ERD: elastic recoil detection
ESA: electrostatic analyzer
ESCA: electron spectroscopy for chemical analysis
ESEM: environmental scanning electron microscope
ESI: electro-spray ionization
ESP: electrospray
ESR: electron spin resonance
ETA: electrothermal analyzer, emanation thermal analysis
EXAFS: extended x-ray absorption fine structure
FAA: flame atomic absorption
FAAS: flame atomic absorption spectroscopy
FABMS: fast-atom bombardment mass spectrometry
FAES: flame atomic emission spectroscopy
FAFS: flame atomic fluoroescence spectroscopy
FAM: field analytical method
FAS: flame absorption spectroscopy
FD: field desorption
FD/FI: field desorption/field ionization
FES: flame emission spectroscopy
FFEM: freeze-fracture electron microscopy
FFF: field flow fractionation
FFFF: flow field flow fractionation
FFM: friction force microscopy
FFS: flame fluorescence spectroscopy
FFT: fast Fourier transform
FGC: fast gas chromatography
FI: flow injection, field ionization
FIA: flow injection analysis
FIB: focused ion beam
FID: flame ionization detector, free-induction decay
FIM: field ion microscopy
FNAA: fast neutron activation analysis
FOCS: fiber optic chemical sensor
FPD: flame photometric detector
FSOT: fused silica open tubular (column)
FT: Fourier transform
FT-ICR: Fourier transform ion cyclotron resonance
FT-IR: Fourier transform infrared (often "FT/IR," "FTIR," "FT IR")
FT-IRRAS: FT-IR reflection-absorption spectroscopy
FT-MS: Fourier transform mass spectrometry
FWHM: full-width half-maximum
GC: gas chromatography
GC-IR: gas chromatography–infrared spectrometry
GCMS: gas chromatography mass spectrometry
GDL: glow discharge lamp
GDMS: glow discharge mass spectrometry
GE: gel electrophoresis, gradient elution
GEMBE: gradient elution moving boundary electrophoresis
GFAAS: graphite furnace atomic absorption spectroscopy
GLC: gas-liquid chromatography
GPC: gel permeation chromatography
GS: Gram-Schmidt (algorithm)
GSC: gas-solid chromatography
GSED: gaseous secondary electron detector
HCL: hollow cathode lamp
HCOT: helically coiled open tubular (column)
HDC: hydrodynamic chromatography
HETCOR: heteronuclear correlation
HETP: height equivalent of (a) theoretical plate(s)
HG: hydride generation
HIC: hydrophoric interaction chromatography
HMBC: heteronuclear multiple-bond correlation
HPAC: high-performance affinity chromatography
HPIAC: high-performance immunoaffinity chromatography
HPLC: high-performance liquid chromatography, high-pressure liquid chromatography
HPTLC: high-performance thin-layer chromatography
HRCGC: high-resolution capillary gas chromatography
HRGC: high-resolution gas(-liquid) chromatography
HS: head space
HSA: hemispherical analyzer
HSC: heteronuclear shift correlation
HSQC: heteronuclear single quantum coherence
IA: isocratic analysis
IAC: immunoaffinity chromatography
IAES: ion-excited Auger electron spectroscopy
IC: ion chromatography
ICP: inductively coupled plasma
ICP-OES: ICP optical emission spectrometry
ICR: ion cyclotron resonance
IDMS: isotope dilution mass spectrometry
IEC: ion-exchange chromatography
IEF: isoelectric focusing
IF: intermediate frequency
IGC: inverse gas chromatography
ILDA: intensified linear diode array
IMAC: immobilized metal-ion affinity chromatography
INADEQUATE: incredible natural abundance double-quantum transfer experiment
INEPT: insensitive nuclei enhancement by polarization transfer
INAA: instrumental neutron activation analysis
IP: ion pairing
IPC: ion-pair chromatography
IPG: immobilized pH gradient
IPMA: ion probe microanalysis
IR: infrared (spectrophotometry)
IRN: indicator radionuclide(s)
IRS: internal reflection spectroscopy
ISCA: ionization spectroscopy for chemical analysis
ISE: ion selective electrode
ISP: ion spray
ISS: ion scattering spectrometry

LAMMS: laser micro mass spectrometry
LARIMS: laser atomization resonance ionization mass spectrometry
LARIS: laser atomization resonance ionization spectroscopy
LASER: light amplification by stimulated emission of radiation
LBB: Lambert-Beer-Bouguer law
LC: liquid chromatography
LC-LS: multidimensional liquid chromatography
LDMS: laser desorption mass spectrometry
LDR: linear dynamic range
LEAFS: laser-excited atomic fluorescence spectrometry
LED: light-emitting diode
LEED: low-energy electron diffraction
LEEM: low-energy electron microscopy
LEI: laser-enhanced ionization
LESS: laser-excited Shpol'skii spectroscopy
LFM: lateral force microscopy
LIDAR: light detection and ranging
LIFD: laser-induced fluorescence detection
LIMS: laboratory information management system
LLC: liquid-liquid chromatography
LLD: lower-limit detection
LLE: liquid-liquid extraction
LNRI: laser non-resonant ionization
LO: local oscillator
LOC: lab on a chip
LOD: limit of detection
LPDA: linear photodiode array
LPSIRS: linear potential-sweep IR reflectance spectroscopy
LRI: laser resonance ionization
LRMA: laser Raman microanalysis
LSC: liquid-solid chromatography
LSE: liquid-solid extraction
LTP: low-temperature phosphorescence
MAE: microwave assisted extraction
MALDI: matrix-assisted laser desorption/ionization
MAS: magic angle spinning
MCD: magnetic circular dichroism
MCP: microchannel plate
MDGC: multidimensional gas chromatography
MDL: method detection limit
MDM: minimum detectable mass
MDQ: minimum detectable quantity
MEIS: medium-energy ion scattering
MEKC: micellar electrokinetic chromatography
MFM: magnetic force microscopy
MID: multiple ion detection
MIKE: mass analyzed ion kinetic energy mass spectrometry
MIP: microwave-induced plasma, mercury intrusion porosimetry
MIRS: multiple internal reflection spectroscopy
MLC: micellar liquid chromatography
MLLSQ: multiple linear least squares
MMF: minimum mass fraction
MMLLE: microporous membrane liquid-liquid extraction
MPD: microwave plasma detector
MPI: multiphoton ionization
MRDL: maximum residual disinfectant level (in water analysis)
MRI: magnetic resonance imaging
MS: mass spectrometry
MS-MS: tandem mass spectrometry
MSPD: matric solid-phase dispersion
MSRTP: micelle-stabilized room-temperature phosphorescence
MWD: microwave (assisted) digestion
NAA: neutron activation analysis
NCIMS: negative chemical ionization mass spectrometry
NDP: neutron depth profiling
NEXAFS: near edge x-ray absorption fine structure
NHE: normal-hydrogen electrode
NICI: negative ion chemical ionization
NIR: near-infrared, near-IR
NIRA: near-infrared reflectance analysis
nm: nanometer
NMR: nuclear magnetic resonance
NOE (nOe): nuclear Overhauser effect
NOESY: nuclear Overhauser effect spectroscopy
NPD: nitrogen-phosphorus detector, normal photoelectron diffraction
NPLC: normal phase liquid chromatography
ODMR: optically detected magnetic resonance
ODS: octadecylsilane
OES: optical emission spectrometry, optical emission spectroscopy
OID: optoelectronic imaging device
OMA: optical multichannel analyzer
OPO: optical parametric oscillator
OPTLC: over-pressured thin-layer chromatography
ORD: optical rotary dispersion
OTE: optically transparent electrodes
PA: proton affinity
PAA: photon activation analysis
PAGE: polyacrylamide gel electrophoresis
PAH: polycyclic aromatic hydrocarbon
PAS: photoacoustic spectroscopy
PB: particle beam
PC: paper chromatography
PCA: principal component analysis
PCR: polymerase chain reaction
PCS: photon correlation spectroscopy
PCSE: partially coherent solvent evaporation
PD: plasma desorption
PDA: photodiode array
PDHID: pulsed discharge helium ionization detector
PDMS: plasma desorption mass spectrometry, polydimethyl siloxane
PED: pulsed electrochemical detection, plasma emission detector, photoelectron diffraction
PES: photoelectron spectroscopy
PET: positron emission tomography
PFIA: process flow injection analysis
PGC: packed-column gas chromatography
pH: negative logarithm of hydrogen ion concentration
PICI: positive ion chemical ionization
PID: photoionization detector
PIXE: particle-induced x-ray emission
p*K*: negative logarithm of an equilibrium constant
PLE: pressurized liquid extraction
PLOT: porous-layer open tubular
PMT: photomultiplier tube
ppb: parts per billion
ppm: parts per million
ppt: parts per thousand, parts per trillion
PSD: position sensitive detector
PTFE: polytetrafluoroethylene
PTR: proton transfer reaction (in mass spectrometry)
PTV: programmable temperature vaporizer

PVD: pulsed voltammetric detection, physical vapor deposition
QCL: quantum cascade laser
QCM: quartz-crystal microbalance
QFAA: quartz furnace atomic adsorption
QIT: quadrupole ion trap
qNMR: quantitative nuclear magnetic resonance
QQQ, QqQ, Q_1qQ_3: triple quadrupole mass spectrometer
QTH: quartz tungsten halogen
QTOF: tandem quadrupole time of flight mass spectrometer
RAA: running annual average
RBS: Rutherford backscattering spectrometry
REELS: reflection electron energy loss spectrometry
RES: reflection electron spectrometry
RF: radio frequency
RHEED: reflection high energy electron diffraction
RIC: reconstructed ion chromatogram
RI: refractive index, retention index
RID: refractive-index detector
RIMS: resonance ionization mass spectrometry
RIS: resonance ionization spectroscopy, range of individual samples
RM: reference material
RNAA: radiochemical neutron activation analysis
ROA: Raman optical activity
ROESY: rotating frame nuclear Overhauser effect spectroscopy
RPLC: reversed-phase liquid chromatography
RRDE: rotating ring-disk electrode
RS: Raman spectroscopy
RSF: relative sensitivity factor
RTIL: room-temperature ionic liquid
RTP: room-temperature phosphorescence
S/N: signal-to-noise ratio
SAE: sonication assisted extraction
SAM: scanning Auger microscopy, self-assembly monolayers
SANS: small-angle neutron scattering
SAW: surface acoustic wave
SAXS: small-angle x-ray scattering
SBSE: stirbar sorptive extraction
SCE: standard calomel electrode, saturated calomel electrode
SCF: supercritical fluid
SCOT: support-coated open tubular
SDD: silicon drift detector
SdFFF: sedimentation field flow fractionation
SEC: size-exclusion chromatography
SEM: scanning electron microscope
SERS: surface-enhanced Raman spectroscopy
SFC: supercritical-fluid chromatography
SFE: supercritical-fluid extraction
SFFF: sedimentation field flow fractionation
SF-MS: sector field mass spectrometry
SFS: synchronous fluorescence spectroscopy
SHE: standard hydrogen electrode
SIA: sequential injection analysis
SIDA: stable isotope dilution assay
SIMS: secondary ion mass spectrometry
SIRIS: sputter initiated resonance ionization spectroscopy
SMCL: secondary maximum contaminant level (in water analysis)
SMDE: static mercury drop electrode
SNIFTIRS: subtractively normalized interfacial FT-IR spectroscopy
SNMS: sputtered neutral mass spectrometry
SPAES: spin-polarized Auger electron spectroscopy
SPE: solid-phase extraction
SPME: solid-phase microextraction
SPR: surface plasmon resonance
SRE: stray radiant energy
SRM: standard reference material
SSMS: spark source mass spectrometry
SSRTF: solid-surface room-temperature fluorescence
SSRTP: solid-surface room-temperature phosphorescence
STEM: scanning transmission electron microscope
STM: scanning tunneling microscope
SVE: solvent vapor exit
SWE: supercritical-water extraction
TCD: thermal-conductivity detector
TCT-GC-MS: thermal cold trap gas chromatography mass spectrometry thermodilatometry
TD: thermodilatometry
TDL: tunable diode laser
TEA: thermal energy analyzer
TED: thermionic emission detector
TEELS: transmission electron energy loss spectrometry
TEM: transmission electron microscope
TET: thermometric enthalpimetric titration
TFFF: thermal field flow fractionation
TGA: thermogravimetric analysis
TGA-IR: thermogravimetric analysis – infrared
THEED: transmission high energy electron diffraction
ThFFF: thermal field flow fractionation
TIC: total ion current chromatogram, tentatively identified compound
TIMS: thermoionization mass spectrometry
TLC: thin-layer chromatography
TLE: thin-layer electrode
TLM: thermal lens microscopy
TLV: threshold limit value
TMA: thermomechanical analysis
TMS: tetramethylsilane
TOCSY: total correlation spectroscopy
TOF: time-of-flight
TOF-MS: time-of-flight mass spectrometry
TSP: thermospray
UHV: ultrahigh vacuum
USE: ultrasonic extraction
UV: ultraviolet
UVPES, UPS: ultraviolet photoelectron spectroscopy
UV-VIS, UV-Vis: ultraviolet-visible
VAR: variable angle reflectance
Vis: visible (radiation)
VOC: volatile organic compound(s)
VOX: volatile organic halogens
VUV: vacuum ultraviolet
W: Wein filter (used in mass spectrometry)
WCOT: wall-coated open tubular
WDS: wavelength dispersive spectrometer
WWCOT: whisker-wall coated open tubular (column)
WWPLOT: whisker-wall coated porous layer open tubular (column)
WWSCOT: whisker-wall support-coated open tubular (column)
XAES: X-ray excited Auger electron spectroscopy, X-ray adsorption edge spectrometry
XANES: X-ray absorption near-edge spectroscopy
XPS: X-ray photoelectron spectroscopy
XRD: X-ray diffraction
XRF: X-ray fluorescence

XRFS: X-ray fluorescence spectroscopy
XRS: X-ray spectroscopy
ZAF: Z (element number) absorption fluorescence

Symbols Used in Analytical Chemistry

***α*:** Auger yield, fine structure constant
***a*$_0$:** Bohr radius
***A*:** absorbance
***A*:** peak asymmetry factor
***B*:** magnetic field strength
[c]: concentration of component c
***d*$_p$:** particle diameter (HPLC stationary phase)
***D*$_{ab}$:** diffusion coefficient
***e*:** electron elementary charge
***ε*:** extinction coefficient
***E*:** energy
***E*:** electrode potential
***E*$_b$:** binding energy
***E*$_{ea}$:** electron affinity
***E*$_i$:** ionization energy
***ν*:** frequency
***γ*:** gyromagnetic ratio
***n*:** refractive index
***h*:** Planck constant
***H*:** enthalpy, plate height
***I*$_0$:** incident intensity
***J*:** coupling constant
***k*:** coverage factor
***k'*:** capacity factor
***λ*:** wavelength, thermal conductivity
***m/z*:** mass-to-elementary-charge ratio (mass spectrometry)
***Q*$_{crit}$:** Q value (outlier test)
***q*:** quadrupole parameter (mass spectrometry)
***r*:** correlation coefficient
***R*:** resolution
***R*$_∞$:** Rydberg constant
***ρ*:** density
***s*:** standard deviation
***s*^{2}:** variance
***δ*:** chemical shift
***δ**:** solubility parameter
***τ*:** true value of a measured quantity
***τ*$_{crit}$:** Chauvanet's criterion (outlier test)
***t*$_{1/2}$:** half life
***t*$_M$:** mobile-phase hold up
***t*$_R$:** retention time
***t*$_R^0$:** specific retention time
***T*:** transmittance
***T*1:** spin-lattice relaxation time
***T*2:** spin-spin relaxation time
$\bar{u}$**:** carrier phase velocity
***V*$_M$:** carrier hold-up volume
***V*$_R$:** retention volume
***V*$_R^0$:** specific retention volume

BASIC INSTRUMENTAL TECHNIQUES OF ANALYTICAL CHEMISTRY

Thomas J. Bruno

The following section provides brief descriptions of the major instrumental methods of chemical analysis. Please note that these paragraphs are general descriptions and are not meant to convey a comprehensive knowledge on these topics. The reader is referred to one of many excellent texts on instrumental methods of chemical analysis for additional details.

Separation Methods

Gas Chromatography (GC): A separation method in which the sample or solute is vaporized (usually in a solvent, but sometimes neat or free of solvent) and passed through a medium under the influence of a carrier gas. The medium is called the stationary phase, in contrast to the carrier gas, which is mobile. The most common modern stationary phases are based on open tubular or capillary columns, in which the separation medium coats the inside periphery of a tube (typically tenths of millimeters in inside diameter) that is between 25 m and 60 m long. Older media are packed columns, consisting of packed beds, which are still used for gas analysis. In these applications, a solid sorbent is very common, and this is called gas-solid chromatography. Some open tubular columns are available with solid sorbents as well. Interactions of the solute with the separation medium affect the separation of the components of the mixture. A wide variety of detectors are available for general or specific applications. One of the most useful combinations is gas chromatography coupled with mass spectrometry (GC-MS). Solutes amenable to analysis by GC are usually of moderate volatility and a relative molecular mass usually not exceeding 400. The most common stationary phases are cross-linked polymers based on dimethyl polysiloxane, the backbone of which can be derivatized with ligands to provide specific interactions. It is also possible to incorporate stereogenic (chiral) stationary phases as well.

Liquid Chromatography (LC, HPLC): A separation method in which a sample or solute (usually in a solvent, but sometimes neat or free of solvent) is passed through a medium under the influence of a carrier liquid. The medium is called the stationary phase, in contrast to the carrier, which is the mobile phase. Unlike gas chromatography, where the carrier gas plays little role other than mass transfer, the mobile phase in liquid chromatography is a controllable variable whose polarity and other properties are varied, in addition to the interactions with the stationary phase, to affect separation. The stationary phase in liquid chromatography is usually a micrometer-size particle packed bed that requires a high-pressure solvent system to cause mass flow. Liquid chromatographic systems have therefore been called high-pressure liquid chromatography (HPLC), although the acronym is usually taken to mean high-performance liquid chromatography. Many variations of the method have been developed for specific analysis. For example, gel permeation chromatography is an adaptation used for the separation of polymers. Affinity chromatography is similar in concept to gel permeation chromatography, but uses the specific interactions between an antibody and an antigen. The use of stereogenic (or chiral) stationary phases is also an important development, especially in the analysis of pharmaceuticals.

Thin-Layer Chromatography (TLC): A separation method in which a stationary phase (typically a polar adsorbent such as alumina or silica gel) coated on a sheet of plastic, aluminum, or glass is used with a mobile phase usually consisting of a solvent or mixture of solvents in a beaker. The solute is applied as a blotted spot just above the end of the adsorbent-coated plate, and then the end is immersed into the solvent (but not so far as to immerse the solute spot). Commercial plates are robust, plastic sheets that can be cut to the desired size. In earlier applications, filter paper has been used in TLC, giving rise to the term "paper chromatography." This term is rarely used today. Solvent is then drawn up through the adsorbent coating by capillary action. Separation results from a combination of interactions with the adsorbent and solvent. Commonly, the separated components are rendered visible by spraying stains or reactants on the plate after separation has been completed. It is also common to view the "developed" plate under an ultraviolet lamp, to visualize spots that may be fluorescent.

Supercritical Fluid Chromatography (SFC) and Supercritical Fluid Extraction (SFE): A separation technology similar to other extraction and chromatographic methods, but in which the mobile phase is actually a fluid in its supercritical fluid state. A supercritical fluid is a fluid that is held above its critical temperature and pressure, and for which no application of additional pressure can result in the development of a liquid phase. Supercritical fluids are unique in that while they possess liquid-like densities, the mass transfer behavior is superior to that of liquids. Supercritical fluid chromatography remains a niche method that is applicable to pharmaceuticals and other high relative molecular mass solutes. Supercritical extraction, on the other hand, is more widely used as a sample preparation method, especially in pharmaceutical analyses, polymers, and environmental analyses.

Electrophoresis: A family of separation methods based on the motion induced in particles by an applied, uniform electric field. The most common application of electrophoresis is gel electrophoresis, in which sample (typically proteins, amino acids, nucleic acids, etc.) is applied to a channel that is formed in a cross-linked polymer, usually polyacrylamide or agarose (the gel). The speed at which the individual species move through the gel under the influence of the field is determined largely by the size of the species, as expressed by the mass-to-charge ratio. After separation, the individual species usually appear as discrete bands that may be better visualized by staining with ethidium bromide, silver, or Coomassie Brilliant Blue dye. Other related and more specific techniques include isoelectric focusing, pulsed-field gel electrophoresis, immunoelectrophoresis, and isotachophoresis.

Purge-and-Trap Sampling: Purge and trap sampling is a family of methods that are used to capture the headspace above a condensed phase for subsequent analysis, most often for complex

mixtures, environmental samples, etc. The headspace is the vapor space that develops above any condensed (solid or liquid) phase. Thermodynamics assures us that the concentration of a particular analyte found in the headspace will be different than that found in the condensed phase, but often the relationship is predictable. The value in the method comes from the simplicity; sample preparation is usually far simpler than the cleanup that is typically required for many complex mixtures. Purge and trap methods fall into two general categories: static and dynamic. The dynamic method typically uses a sweep gas to continuously purge vapor analytes into a cold (cryogenic) trap or an adsorbent. Modern dynamic purge and trap methods include PLOT column cryoadsorption, which uses a combined adsorbent and cryotrapping on a high efficiency platform. Static methods typically employ a syringe to pressurize the headspace above a condensed phase, followed by uptake of the pressurized headspace into a trap. A modern static method (that usually is done without pressurization) is solid-phase microextraction (SPME). This method utilizes a fiber coated with a stationary phase (similar to stationary phases used for gas and liquid chromatography) at the end of a wire mounted in a syringe needle.

Spectroscopic Methods

Mass Spectrometry (MS): An analytical technique in which charged particles or radical ions are produced from a sample by either electron impact (bombardment with a stream of electrons) or chemical ionization (interaction with a small charged ion). Analysis on the basis of the mass-to-charge ratio is performed on fragments of the molecule that develop after the initial ionization. The method is very useful for mass determination and structure determination on the basis of the induced fragmentation pattern. The charged fragments can be separated or analyzed by a magnetic sector, a quadrupole, an ion trap, by time of flight, or by cyclotroning. When coupled to separation techniques such as gas or liquid chromatography, a nearly universal qualitative detection capability is provided. Structure determination can be performed by comparison to well known fragmentation patterns or characteristics. When a mass spectrometer is capable of high mass resolution (0.0001 RMM units), a nearly unequivocal identification of a compound formula is possible. While direct interfaces and gas chromatographs are the most common sample introduction techniques, many others are available for specific applications. Matrix-assisted laser desorption/ionization (MALDI) is often used in time-of-flight instruments, and is especially useful for analysis of biopolymers. Inductively coupled plasma ionization is capable of producing mass spectra of high sensitivity for many metals and some nonmetals. When coupled to liquid chromatography instrumentation, thermospray and electrospray methods have been used with HPLC for analytes that are not amenable to gas chromatography separation. In addition to the interfaces discussed above, tandem mass spectral methods are of great value, especially for confirmatory analysis. In this respect, a fragment is selected for further fragmentation and analysis. The most common types of tandem mass spectrometry involve quadrupoles coupled with a time of flight (Q-TOF) and multiple (usually three) quadrupoles in series, called a triple quad (QQQ or QqQ). More details can be found in the entry "Varieties of Hyphenated Gas Chromatography and Mass Spectrometry."

Ultraviolet Spectrophotometry (UV, UV-Vis): A spectroscopic technique that focuses on electronic transitions in the visible and ultraviolet regions of the electromagnetic spectrum used for excitation and detection. The practical ultraviolet region extends from 190 nm to 400 nm in wavelength. The UV region can be divided into subranges: near-UV: 300 nm to 400 nm, mid-UV: 300 nm to 200 nm, far-UV: 200 nm to 122 nm, and vacuum-UV: 200 nm to 100 nm. Other divisions are possible, but these are less important for analytical chemistry. The visible region, so called because of the response of human vision, extends from about 390 nm to 750 nm in wavelength. Although it is possible to use ultraviolet visible spectrophotometry for structure determination, it is most often used as a quantitative tool. The wavelength-structure correlations are not as detailed, nor the spectra as sharp, as with other spectroscopic methods such as infrared spectrophotometry. The utility of UV-Vis absorptions for many organic compounds has led to this instrument being adapted as a detector for liquid chromatography. Related to ultraviolet spectrophotometry are fluorescence spectroscopic methods. In these methods, the energy emitted is at a different wavelength (usually longer, of lower energy) than the incident radiation, and this is typically detected perpendicular to the incident excitation beam. This makes fluorescence spectroscopy more sensitive than UV-Vis spectroscopy. This type of instrument is also incorporated as a detector for liquid chromatography.

Infrared Spectrophotometry (IR, FTIR): A spectroscopic technique that focuses on molecular vibrations (with a concurrent change in dipole moment) in the infrared (IR) region of the electromagnetic spectrum for excitation and detection. This region is further divided into three separate but overlapping ranges. The near-infrared (high energy IR, approximately 12 500 cm^{-1} to 4000 cm^{-1}, 0.8 μm to 2.5 μm wavelength) is used to study overtone or harmonic vibrations. The mid-infrared (mid-range energy IR, approximately 4000 cm^{-1} to 400 $^{-1}$, 2.5 μm to 25 μm wavelength) is used to study the fundamental vibrations and associated rotational-vibrational combinations. The far-infrared (low energy IR, approximately 400 cm^{-1} to 10 cm^{-1}, 25 μm to 1000 μm wavelength) is adjacent to the microwave region and is used to study rotational transitions. Most modern instruments use the Fourier transform (FT) technique to record the spectrum over all wavelengths, rather than by scanning through the wavelengths. The absorbances of the IR radiation are associated with specific chemical moieties, and a study of the spectra can be used to aid in structure determination. One often uses structure correlation charts to aid in assignment of absorbance bands. An analysis of the intensity of the absorptions can also be used for quantitative analysis.

Nuclear Magnetic Resonance Spectrometry (NMR): A spectroscopic method that takes advantage of the fact that magnetic nuclei (nuclei with an odd number of protons and/or neutrons, having an intrinsic magnetic moment and angular momentum), when placed in a magnetic field, will absorb pulses of electromagnetic radiation and then radiate this energy back out for detection. For these nuclei, the energy and signal intensity are proportional to the applied magnetic field. The power of NMR results from the ability to probe the molecular environment around a particular nucleus, thus making it a favorite tool of the organic chemist. This is done by measurement of the chemical shift (or frequency) of an absorption, and by the analysis of splitting patterns, which are caused by the influence of adjacent nuclei. New high-field, high-sensitivity instruments have given this technique more applications in analytical chemistry. The most commonly studied nuclei are ^{1}H (proton, the most NMR-sensitive isotope after the radioactive ^{3}H) and ^{13}C. With high-field instruments, additional nuclei are accessible: ^{2}H, ^{10}B, ^{11}B, ^{14}N, ^{15}N, ^{17}O, ^{19}F, ^{23}Na, ^{29}Si, ^{31}P, ^{35}Cl, ^{113}Cd, ^{129}Xe, and ^{195}Pt.

Raman Spectroscopy: A vibrational spectroscopic method that arises from the inelastic scattering of monochromatic

radiation by molecules that undergo a change in polarizability during the vibration. This is in contrast to infrared spectrophotometry, in which a change in the dipole moment occurs during the vibration. When radiation (typically light from a laser in the visible, near-infrared, or near-ultraviolet range) is scattered, a small fraction of the scattered radiation is observed to have a different frequency (the Raman effect). The variations of Raman spectroscopy are used to locate functional groups or chemical bonds in molecules. There are several variations in the approach to Raman spectroscopy. In resonance Raman spectroscopy, the excitation wavelength is matched to an electronic transition of the molecule, enhancing the vibrational modes. In coherent anti-Stokes Raman spectroscopy (CARS), two laser beams are used to generate a coherent anti-Stokes frequency beam. In surface-enhanced Raman spectroscopy (SERS), surface plasmons (a quantum of plasma oscillation) on a silver or gold colloid on a surface (such as a mirror) are excited by the laser, resulting in an increase in the electric fields surrounding the metal.

Atomic Absorption Spectroscopy (AAS) and Atomic Emission Spectroscopy (AES): Two related spectroscopic methods applied primarily to the analysis of inorganic compounds. Atomic absorption procedures use the absorption of optical radiation (light) by free atoms in the gaseous state. The light can be produced by a hollow cathode lamp, an electrodeless discharge lamp, or a deuterium lamp. The light is absorbed by the analyte during an electronic transition, the wavelength of which corresponds to only one element in the analyte, and the width of an absorption line is of the order of only a few picometers. This method can be used for the quantitative determination (on the basis of a calibration curve) of approximately 70 different elements in solution or directly in solid samples. Atomic emission spectroscopy (AES) uses the light emitted by a vaporized sample in a flame, plasma, arc, spark, or laser, at a particular wavelength, to determine the atomic spectrum (for determination of the elemental composition) and to determine the quantity of an element in a sample. The wavelength of the atomic spectral line gives the identity of the element while the intensity of the emitted light is proportional to the number of atoms of the element. No single source, as described above, is optimal for a given sample, and it is the choice of source that distinguishes the various techniques.

Miscellaneous Methods

Colorimetry, Spot Tests, Presumptive Tests: Rapid, simple tests based on color change are frequently used as the basis of preliminary conclusions or approximate concentration measurement. Colorimetric methods use simple comparative instruments to determine the concentration of colored compounds in solution. These devices, called colorimeters, can be manual or automatic, and use filtered light in the visible region (between 400 nm and 700 nm). In both cases, the operation depends upon having multiple solutions, including a blank, for comparison with a solution of unknown concentration. Manual colorimeters function by measuring the variable light path through the unknown solution as compared to a known solution until a match is achieved visually. The product of concentration and path length matches when the concentrations are the same, so an unknown concentration may be obtained by a proportion. Automated devices function similarly but with photocells. Colorimetric tests are usually done following four basic protocols: (1) an unknown can be treated/reacted with a reagent to form a new compound which is colored, (2) a chelate complex is formed having a different color than the starting compound, (3) a colored compound is oxidized or "bleached" by another compound, resulting is less color, or (4) an intermediate is formed that can be oxidized or reduced later to a colored compound. Related to colorimetric methods are spot tests, often called presumptive tests in forensic science (since they are used to establish probable cause, or for ordering and performing more sophisticated tests), which are the observations of color changes upon the addition of one or more reagents to an unknown. Spot tests are inherently simple, and are done with a drop or two of reagent(s), on a filter paper or other suitable medium, and generate minimal waste. Usually instrumentation is not used, one merely notes a color change, although simple devices such as handheld color space analyzers (used in the paint industry) can be helpful. Other approaches include the recording of a digital photograph of the spot and the determination of the L*, a*, and b* axes in LAB color space. An example of spot testing for presumptive purposes includes the addition of cobalt thiocyanate ($CoC_2N_2S_2$) to cocaine, producing a blue color (the Scott test). These tests are presumptive rather than confirmatory because of the potential of false positives. Thus, the Scott test will also produce a blue coloration in the presence of lidocaine and diphenylhydramine.

Refractometry: Refractometry is the measurement of the degree to which the path of electromagnetic radiation, specifically light, is bent upon traversing from one medium to another. Indirectly, a refractometer measures the speed of light since the refractive index, the measurand provided by a refractometer, is defined as the speed of light in vacuo divided by the speed of light in a particular medium (which can be a gas, liquid, or solid). Refractive index typically varies between 1.3000 and 1.7000 for most compounds, and being a ratio, it is dimensionless. The refractive index of vacuum is by definition unity. Refraction is the result of differing densities of media; light passes through dense media slower than it passes through less dense media. Refractive index is dependent on temperature and the wavelength of light used for the measurement, and when both are known for a media, it can be used as an indication of composition or concentration. Thus, the refractive index is typically measured with light from the sodium D-line (589 nm), and often at a temperature that is near ambient (20 °C). The measurand is thus indicated as n_D^{20}. As an analytical tool, refractometry is used in four primary ways. First, it is used to help identify compounds by comparison with known values. Second, it is used to assess purity by comparison with the refractive index of a pure material. Third, it is used as a measure of solute concentration of a solution, by reference to a calibration curve. Finally, it is used as the basis of universal detection in HPLC. Refractometers are commercially available as small handheld instruments, both manual and digital (that can be carried in a pocket), Abbe refractometers (the typical lab bench device usually equipped with a thermostat), and in-line refractometers such as those used for HPLC detectors.

Thermal Analysis (TA) Methods: A family of analytical techniques in which various properties of a sample are examined as a function of changing temperature at a particular rate of change. For chemical analysis, the most common thermal analysis techniques include differential thermal analysis (DTA) and thermogravimetric analysis (TGA). In chemical analysis, there are many other thermal analysis methods available, perhaps the common of which is differential thermal analysis, used for determination of phase transitions. In chemical analysis, TGA is used to determine a mass change as a function of temperature. This is used to determine decomposition or degradation temperatures, moisture content of materials (although Karl Fisher coulombic titrimetry is also used for this), the level of inorganic and organic

components in materials, decomposition points of explosives, and solvent residues in materials. DTA, on the other hand, monitors a temperature change rather than a mass change and is used for determination of phase transitions. In this respect, it is useful as a complementary technique to probe the energetics of decomposition, moisture loss, etc. Other thermal analysis methods, such as differential scanning calorimetry (DSC), are not primarily analytical tools but rather thermophysical property measurement tools.

X-Ray Methods: A family of techniques that utilize radiation in the x-ray region, with wavelengths between 0.01 nm to 10 nm (corresponding to frequencies in the 3×10^{16} Hz to 3×10^{19} Hz range) to analyze for the presence of elements in a sample. In X-ray fluorescence spectroscopy (XRFS), short wavelength X-rays are used to excite secondary or fluorescent x-rays from a sample. The wavelength of X-rays used to excite the sample must be shorter than the expected fluorescence wavelength. The sample is typically presented as a powdered solid on a glass plate. Spectra are generated by changing the incident angle between the source and the sample with a device called a goniometer. The fluorescent signals obtained are very precise and specific, and can rival wet chemical methods for the identification of elements. Auger electron spectroscopy (AES) is a surface analysis method that measures the electrons emitted from a surface by electron bombardment of the surface. This method is considered to be in the same family as X-ray methods because during electron bombardment, the surface can lose energy either by electron emission (the Auger effect, via Auger electron emission) or X-ray emission. These methods are in contrast to X-ray diffraction methods, in which a crystal structure measurement is desired.

Flow Injection Analysis (FIA): An analytical protocol that seeks to replace the manual "test tube and beaker" aspects of wet chemical analysis by injecting an analyte in a flowing stream of a carrier reactant. As the analyte flows with the reactant stream, it diffuses into the reactant and product forms. Ultimately, the product zone, under the influence of the moving reactant, is passed into a detector section. The detection devices can consist of the same wide variety as is used in HPLC. The major advantage of flow injection analysis is the automation and decreased uncertainty associated with sampling and reagent addition. Strict control of reagent concentration, flow rate, and analyte volume is possible. Modern applications of FIA include the sequential addition of analyte and reactant in a stream so that the two are "stacked" in an inert carrier. They then mix by the parabolic flow profile of a laminar flowing stream in a tube. This arrangement can be miniaturized within a sampling valve, forming the so-called lab-in-a-valve approach.

ANALYTICAL STANDARDIZATION AND CALIBRATION

Thomas J. Bruno

Overview

Most modern instrumental techniques used in analytical chemistry produce an output or signal that is not absolute; the signal or peak is not a direct quantitative measure of concentration or target analyte quantity. Thus, to perform quantitative analysis, one must convert the raw output from an instrument (information) into a quantity (knowledge). This is done by standardizing or calibrating the raw response from an instrument (Refs. 1-4). Here, we briefly summarize the most common methods applied in analytical chemistry, recognizing that this is a very large field. We note that the common use of the term "standardization" is not to be confused with the application of standard methods as specified by regulatory or consensus standard organizations.

Samples

In all of the discussion to follow, we assume that the sample has been properly drawn from the parent population material, and properly prepared. Clearly, the most precise analytical methods and the most painstaking calibration methods are useless if applied to a sample that does not represent reality. Nevertheless, the term "sampling," which describes the process of obtaining the sample (from the population material), implies the existence of a sampling uncertainty (arising mainly from population material heterogeneity) (Refs. 5 and 6). Thus, the analytical result is an estimate of what would be obtained from the parent population material. The theory, concepts, and nomenclature regarding samples and sampling constitute a complex, statistically based, subspecialty of analytical chemistry well beyond the scope presented here. We begin with some simplified definitions (Ref. 7):

Amount of substance: The amount of substance is the fundamental quantity of material measured in the number of moles.

Analyte: The analyte is the target component or compound in the sample for which one desires a measurement.

Aliquot: An aliquot is a known fraction of a homogeneous mass or volume.

Bias: As applied to sampling, bias refers to a systematic displacement, error, uncertainty. or mistake caused by a flaw in the sampling procedure.

Convenience sample: A sample chosen on the basis of accessibility, expediency, cost, efficiency, or other reason not directly concerned with sampling parameters.

Determination: The determination is the entire analytical procedure or method performed on a test portion.

Matrix: The matrix is the background or carrier material of the sample that includes all components except the analyte(s) of interest.

Phase: The phase describes the physical state of a substance: primarily solid, liquid, gas, but this term might include more detailed descriptions to include supercritical fluid, plasma, etc. Note that the term "vapor" typically refers to a gas phase above and in equilibrium with a condensed phase (often called the headspace in chemical analysis).

Population material: The population material is the entirety of the bulk material from which the sample is drawn. This might be a plot of earth, a warehouse full of sugar, or a tank of jet fuel.

Quantity: The quantity refers to the mass or volume of a substance.

Random sample: A sample selected so that any portion of the sample has an equal or known chance of being chosen for measurement.

Representative sample: A sample resulting from a sampling process that can be expected to adequately reflect the properties of interest of the parent population. A representative sample may be a random sample. The degree of representativeness of the sample is limited by cost or convenience.

Selective sample: A sample that is deliberately chosen by using a sampling plan that eliminates materials with certain characteristics or selects only a material with other relevant characteristics desired for an analysis.

Test portion: The test portion is the actual material removed from a sample for analysis.

Umpire sample: A sample taken, prepared, and stored in an agreed upon manner for the purpose of settling a dispute, arrived at by agreement that will include the test method and procedure, serving as the basis for acceptance, rejection, or economic adjustment. This is sometimes called a referee sample.

Test portion: The test portion is the actual material removed from a sample for analysis.

Unknown: The unknown is a term that describes the target measurement or unknown quantity that is desired for the analyte, or the analyte itself.

Sampling uncertainty is that part of the total uncertainty in an analytical procedure or determination that results from using only a fraction of the population material. In this respect, sampling by any method is an extrapolation process. Since the sampling uncertainty is usually ignored for an individual analysis on an individual test portion, the sampling uncertainty is considered as being due entirely to the variability of the test portion. It is therefore assessed, when necessary, by replication of the sampling from the parent population material, and statistically isolating the uncertainty thus introduced by analysis of the variance. Typically, the problems associated with liquid population material are less complex but must not be ignored. Sample stratification, concentration and thermal gradients, poor mixing, and gradients associated with flow are all real effects that must be considered. Sampling uncertainty is often minimized by field and laboratory processing, with procedures that can include mixing, reduction, coning and quartering, riffling, milling, and grinding.

Another aspect that must be considered subsequent to sampling is sample preservation and handling. The integrity of the sample must be preserved during the inevitable delay between sampling and analysis. Sample preservation may include the addition of preservatives or buffer solutions, pH adjustment, use of an inert gas "blanket," and cold storage or freezing.

Calibration and Standardization

External Standard Methods

The external standard method can be applied to nearly all instrumental techniques, within the general limits discussed here, and the specific limitations that may be applicable with individual techniques. This method is conceptually simple; the user constructs a calibration curve of instrumental response with prepared mixtures containing the analyte(s) over a range of concentrations, an example of which is shown in Fig. 1a. Thus, the curve represents the raw instrumental response of the analyte as a function of analyte concentration or amount. Each point on this plot must be measured several times so that the repeatability can be assessed. Only random uncertainty should be observed in the replicates; trends of increasing or decreasing response (hysteresis) must be remedied by identifying the source and adjusting the method accordingly. The calibration solutions should be randomized (that is, measured in random order). Although called a calibration "curve," ideally the signal versus concentration plot is linear, or substantially linear (that is, areas of nonlinearity are unimportant, otherwise they are localized, minor, and properly treated by the measurement technique). In some cases, the response may be linearizable (for example, by calculating the logarithm of the raw response). If a curve shows nonlinearity in an area that is important for the analysis, one must measure more concentrations (data points) in the region of curvature.

In practice, the line that results from the calibration is fit with an appropriate model, and the desired value for the unknown concentration is calculated. The curve can be used graphically if approximation suffices. Mixtures prepared for external standard calibration can contain one or many analytes. Once a calibration curve is prepared, it can often be used for some time period, provided such a procedure has been previously validated (that is, the stability of the standards and the instrument over the time of use has been assessed). Otherwise, it is best to measure the unknown and the standards within a short period of time. Moreover, if any major change is made to the instrumentation (changing a detector or detector parameters, changing a chromatographic column, etc.), the standards must be re-measured.

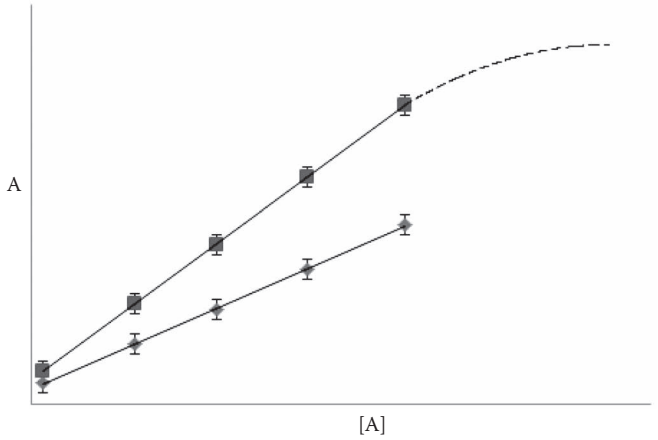

Fig. 1a: An example calibration curve prepared by use of the external standard method. The instrument response is represented by *A*, and the concentration resulting in that response is [A]. While curves for two analytes are shown, in principle, one can plot as many analytes as desired. While five points per analyte have been shown, one can measure as many as required. Note that a region of nonlinearity is shown in the latter part of the curve for one of the components. One would require a larger number of points to adequately represent and fit any nonlinear areas.

To successfully use the method, the standard mixtures must be in a concentration range that is comparable to that of the unknown analyte, and ideally should bracket the unknown. Multiple measurements of each standard mixture should be made to establish repeatability of points on the curve. Many instrumental methods have operation ranges (frequency, temperature, etc.) in which the uncertainty is minimized, so components and concentrations for standard mixtures must respect this. The standard mixtures should be in the same matrix as the unknown, and the matrix must not interfere with the unknown or other standard mixture components. Any pretreatment of the unknown must also be reflected in the standard mixtures. As with any calibration method, components in the standard mixtures must be available at a high (or at least known) purity, they must be stable during preparation, and must be soluble in the required matrix. Unless the physical phenomenon of a measurement is well understood, extrapolation beyond the curve is not recommended (and indeed is usually strongly discouraged); nevertheless, extrapolation is occasionally done in practice. In those cases, one must be cautious, report exactly how the extrapolation was done, and assess any increase in uncertainty that may result. Note that the curve might not extrapolate through the origin. This is usually the result of adsorption (of components on container walls), carryover hysteresis, absorption (of components in seals or septa), or component degradation or evaporation.

A major consideration with external standardization is that typically, the sample size (for example, the injection volume in chromatography) must be maintained constant for standard mixtures and the unknowns. If the sample size varies slightly, it is often possible to apply a correction to the raw signal. One should not attempt to generate a calibration curve by varying the sample size (that is, for example, injecting increasing volumes into a gas chromatograph). This caution does not preclude serial dilution methods (see below), in which multiple solutions are generated for separate measurement. Other issues that can hinder successful application of the external standards method include instrumental aspects that might not be readily apparent. In chromatographic methods, for example, one can overload the column or detector. In older instruments, settings of signal attenuation were typically made manually, while in newer instruments, this may occur through software, sometimes without operator interaction or knowledge.

Note, *inter alia,* that in Fig. 1a (and indeed all the examples presented here), the uncertainty is only indicated for the variable on the *y*-axis. In reality, we must recognize that there is uncertainty for the values plotted on the *x*-axis as well, but we often only treat the largest uncertainty, or the uncertainty that is most important for our application. Note, also, that it is critical to maintain the integrity of standards; decomposition, degradation, moisture uptake, etc., will adversely affect the validity of the calibration.

Abbreviated External Standard Methods

In many situations in chemical analysis, a full calibration curve is not prepared because of the complexity, time, or cost. In such situations, abbreviated external standard methods are often used. Under no circumstances can an abbreviated method be used if the raw signal response is nonlinear. Moreover, these methods are not generally appropriate for analyses in regulatory, forensic, or health care environments where the consequences can be far-reaching.

Single Standard

This method uses a simple proportion approach to standardize an instrument response. It can be used only when the system

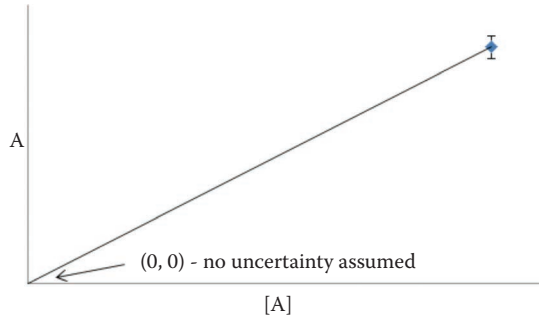

Fig. 1b: An example of a single-point calibration curve. The instrument response is represented by *A*, and the concentration resulting in that response is [A]. The origin (0,0) is assigned as part of the curve, and is assumed to have no uncertainty.

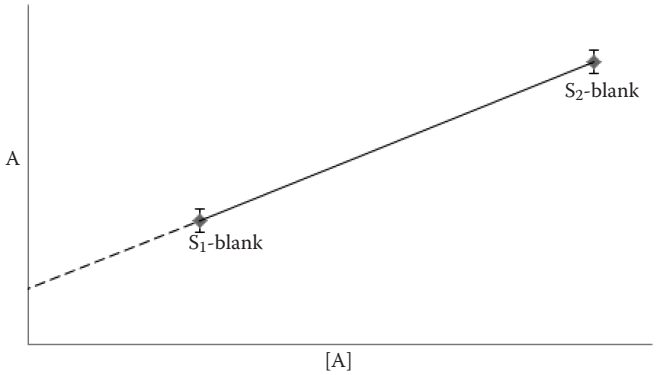

Fig. 1c: An example of two standards plus a blank calibration curve. The blank is subtracted from each of the standards. The instrument response is represented by *A*, and the concentration resulting in that response is [A].

has no constant, determinate error or bias*, and when the reagents used give a zero blank response (that is, the instrument response from the matrix and measurement system only, without the analyte). A standard should be prepared such that the concentration is close to that of the unknown. One then calculates the concentration of the unknown, [X], as:

$$[X] = (A_x/A_s)\,[S] \quad (1)$$

where A_x is the instrument response of the unknown, A_s is the instrument response of the standard, and [S] is the concentration of the standard.

Single Standard Plus Assumed Zero

This method, illustrated schematically in Fig. 1b, assumes that the blank reading will be zero. One uses a two-point calibration in which the origin is included as the first point. It is important to ensure, by experiment or experience, that such a method is adequate to the task.

Single Standard Plus Blank

If the analytical method has no determinate error or bias, but does produce a finite blank value, then one must also perform a blank measurement, which is subtracted from the instrument response of the standard and the unknown. Then the same procedure (Eq. 1) is used as for the single standard. If multiple samples are to be measured, it is important to measure the blank between each measurement.

Two Standards Plus Blank

When the analytical method has both a determinate error (or bias), and a finite blank value, at least three calibrations must be made: two standards and one blank. The standard concentrations are typically prepared widely spaced in concentration, and the higher concentration should be chosen to represent the limit of linearity of the instrument or method. If this is not practical, the higher concentration should simply be the highest expected concentration of the analyte (unknown). This method is illustrated schematically in Fig. 1c. If multiple samples are to be measured, it is important to measure the blank between each measurement.

Internal Normalization Method

As mentioned above, the raw signal from an analytical instrument is typically not an absolute measure of concentration of the analyte(s), because the instrument may respond differently to each component. In some cases, such as with chromatographic methods, it is possible to apply response factors, determined from a standard mixture containing all constituents of the unknown sample, for standardization (Ref. 8). The standard mixture is gravimetrically prepared (with known mass percents for each component), and the instrument response is measured, for example as chromatographic areas. The total mass percent and the total area percent each sum to 100. One calculates the ratio of each mass percent to each area, choosing one component as the reference, which is assigned a response factor of unity. To obtain the response factors of all the other components, one divides its (mass%-to-area ratio) with that of the reference. This is done for all components, producing a response factor for all components, except of course for the reference, defined as unity. When the unknown sample is measured, the response factor is multiplied by each raw area, and the resulting area percent provides the normalized mass percent of each component in the unknown.

This method corrects for minor variations in sample size (earlier defined as the test portion), although large differences in sample size must be avoided so that one is assured of consistent instrument performance. Although the method corrects for the different responses of samples, large differences must be avoided. This also means that the detector must respond linearly to the concentrations of each component, even if the concentrations are very different. This may require dilution or concentration of the sample in some situations. In chromatographic applications, all components of a mixture must be analyzed and standardized, since normalization must be performed on the entire sample.

Some techniques, such as gas chromatography with flame ionization detection and thermal conductivity detection, have well defined physical phenomena associated with output signals. With these techniques, there are some limited, published response factor data that can be used in an approximate way to standardize the response from these devices.

In Situ Standardization

While it is rare that an analytical method can be calibrated by use of a single solution, some instances of spectrophotometry and electroanalytical methods can qualify. To use this method one sequentially and incrementally adds known masses of standard analytes to a solution, with an instrument response being measured after each addition. This procedure can only be used if the analytical method itself does not change the analyte concentration

* Determinate error and bias are related terms that describe uncertainty that arises from a fixed cause, and that can, in principle, be eliminated if recognized. Determinate error (or systematic error) is most often associated with a measurement, while bias can be associated with either a measurement or with the sampling procedure.

(nondestructive) and does not lead to a loss of solution volume. A solid crystalline analyte is an example. One must also minimize changes in solution volume over the course of the standardization.

Standard Addition Methods

Samples presented for analysis often are contained in complex matrices with many impurities that may interact with the analyte, potentially enhancing or diminishing a signal from an instrumental technique. In such cases, the preparation of an external standard calibration curve will be impossible, because it might be very difficult to reproduce the matrix. In these cases, the standard addition method may be used. A standard solution containing the target analyte is prepared and added to the sample, thus accounting for the unknown impurities and their effects. While the quantity of target analyte in the target sample is unknown, the added quantity is known, and its incremental additive effect on the instrument signal can be measured. Then, the quantity of the unknown analyte is determined by what is effectively an extrapolation. In practice, the volume of the standard solution added is kept small to avoid dilution of the unknown impurities by no more than 1% of the total signal. This method can only be used if there is a verified linear relationship between the signal and quantity of analyte. If a determinate error is present, then the slope of the line must be known. Moreover, the sample cannot contain any components that can respond as the analyte (that is, masquerade).

Single Standard Addition

In the simplest case, one addition of analyte is made after first measuring the response of the analyte in the unknown sample. Thus, two measurements are required:

$$A_{xo} = m[X_0] \quad (2)$$

$$A_{xi} = m([X_o] + [S]), \quad (3)$$

where A_{xo} is the instrument response of the analyte in the unknown sample, $[X_0]$ is the concentration in the unknown sample, and A_{xi} is the instrument response upon the addition of the standard, [S] (additive in equation because X and S are the same compound). The assumed slope is the proportionality constant, m. The two equations are solved simultaneously for $[X_0]$. This technique is very rapid and economical, but there are serious drawbacks. There is no built in check for mistakes on the part of the analyst, there is no means to average random uncertainties, and there is no way to detect interference (mentioned above as masquerade).

Multiple Standard Addition

This standard addition method alleviates some of the problems inherent in single standard addition. Here, the unknown sample is first measured in the instrument. Then that sample is "spiked" with incrementally increasing concentrations of the analyte, generating a curve such as that shown in Fig. 1d. The curve should extrapolate to zero signal at zero concentration. The concentration of the analyte in the unknown is read or calculated from the abscissa (x-axis).

Internal Standard Methods

An internal standard is a compound added to a sample at a known concentration, the purpose of which is to exhibit a similar signal when measured in an instrument, but be distinguishable from the signal of the desired analyte. It provides the highest level of reliability in quantitation by chromatographic methods, and is not affected by large differences in sample size (Ref. 8). Unlike

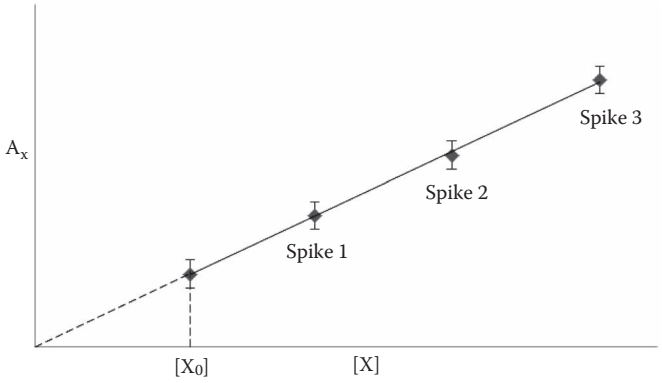

Fig. 1d: An example of calibration by multiple standard addition. Three additions (spikes) of the analyte X are shown, as is the extrapolation to the unknown concentration, X_0.

the internal normalization method, it is not necessary to elute or measure all the components of the sample, one need focus only on the component(s) of interest. In atomic spectrometry, this method is not affected by changes in gas flow rates, sample aspiration rates, and flame suppression or enhancement. Another situation in which this method is valuable is when the sample matrix is either unknown or very complex, precluding the preparation of external standards.

Multiple Internal Standards

A set of calibration solutions is prepared by mass, containing the target analyte, X, and a standard that is not present in the unknown sample, A. The instrument response (for example, a chromatographic area) is measured for each calibration solution, and a plot is made to establish linearity as in Fig. 1a. The ordinate axis is the ratio of the response of the unknown analyte component, A_x, to the response of the chosen standard, A_s. The abscissa is the ratio of mass of X to the mass of S for that standard mixture. Once the linearity is confirmed in the concentration range of interest, the unknown is spiked with a known mass of S, the instrument response is measured, and the area ratio A_x/A_s is calculated. Either the graph or a fit of the data on Fig. 1e is then used to determine the corresponding mass fraction, from which the mass of X may be determined. Note that the calculations could be simplified if the same mass per volume of the

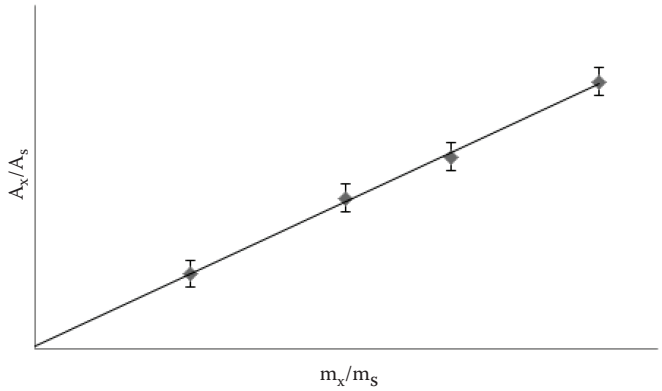

Fig. 1e: An example of the multiple internal standard method. The ordinate (y) axis is the ratio of the response of the unknown analyte component, A_x, to the response of the chosen standard, A_s. The abscissa (x) axis is the ratio of mass of X to the mass of S for that standard mixture.

internal standard is added to both the unknown samples and the calibration standards.

Single Internal Standard

In practice, once the linearity is established for a given mixture, it is no longer necessary to use multiple standards, although this is the most precise method. Subsequent to the verification of linearity, one standard solution can be used to fix the slope, provided it is close in concentration to that of the target analyte. In this case, the mass of the unknown can be found from:

$$X/S = (A_x/A_s)(1/R), \tag{4}$$

where X is the mass of the unknown analyte in the sample, S is the mass of the added internal standard in the sample, A_x and A_s are the instrument responses (areas) of the unknown and internal standard, respectively. R is a ratio determined from the standard solution prepared with both X and S: (mass, unknown analyte/mass, internal standard)/(signal, unknown analyte/signal, internal standard) = R.

$$\left(\frac{\left(\frac{\text{mass, unknown analyte}}{\text{mass, internal standard}} \right)}{\left(\frac{\text{signal, unknown analyte}}{\text{signal, internal standard}} \right)} \right) = R \tag{5}$$

Since R is the slope of the calibration curve discussed above, once linearity is established, one solution suffices. There are many conditions that must be fulfilled in order to use the internal standard method, and it is rare that all of them can actually be met. Indeed, in practice, one tries to meet as many as possible, but those that are mandatory are italicized. The compound chosen *must not be present* already in the unknown. The compound chosen *must be separable from the analyte* present in the unknown. An exception occurs when an isotopically labeled standard is used, in conjunction with mass discrimination or radioactive counting detection. In a chromatographic measurement, this is typically at least baseline resolution, although this would be a minimally acceptable degree of separation. On the other hand, the unknown analyte peak and the internal standard peak should be close to each other (temporally) on the chromatogram. The compound chosen *must be miscible* with the solvent at the temperature of reagent preparation and measurement. The compound chosen must not react chemically with the sample or solvent, or interfere in any way with the analysis. It is critical to maintain the integrity of standards; decomposition, degradation, moisture uptake, etc., will adversely affect the validity of the calibration. In the case of a chromatographic measurement, the same applies to interactions with the stationary phase. The compound chosen must be chemically similar (for example, in functionality, thermophysical properties) to the analyte. If such a compound is not available (for example, in a chromatographic measurement), an appropriate hydrocarbon should be chosen as a surrogate. The standard solution should be prepared at a similar concentration as in the unknown matrix; ratio correction of large differences is no substitute for an appropriate concentration. In a chromatographic measurement, the compound chosen must elute as closely as possible to the analyte, and should not be the last peak to elute (the final peak often shows different geometry such as tailing). The compound chosen must be sufficiently nonvolatile to allow for storage as needed. When there is the potential for the unknown analyte to be lost by adsorption, absorption, or some other interaction with the matrix or container, a compound called a carrier is sometimes added in large excess. The carrier is similar, chemically and physically, to the unknown analyte, but easily separated from it. Its purpose is to saturate or season the matrix and prevent analyte loss.

Serial Dilution

Serial dilution is less a standardization method as it is a method of generating solutions to be used for standardizations. Nevertheless, its importance and utility, as well as the popularity of its application, warrants mention in this section. A serial dilution is the stepwise dilution of a substance, observant of a specified, constant progression, usually geometric (or logarithmic). One first prepares a known volume of stock solution of a known concentration, followed by withdrawing some small fraction of it to another container or vial. This subsequent container is then filled to the same volume as the stock solution with the same solvent or buffer. The process is then repeated for as many standard solutions as are desired. A ten-fold serial dilution could be 1 M, 0.1 M, 0.01 M, 0.001 M, etc. A ten-fold dilution for each step is called a logarithmic dilution or log-dilution, a 3.16 fold ($10^{0.5}$ fold) dilution is called a half-logarithmic dilution or half-log dilution, and a 1.78 fold ($10^{0.25}$ fold) dilution is called a quarter-logarithmic dilution or quarter-log dilution. In practice, the ten-fold dilution is the most common. The serial dilution procedure is not only used in chemical analysis but also in serological preparations in which cellular materials such as bacteria are diluted. A critical aspect of serial dilution is that the initial solution concentration must be prepared and determined with great care, since any mistake here will be propagated into all resulting solutions.

Traceability

Analytical measurements and certifications often contain a statement of traceability. Traceability describes the "result or measurement whereby it can be related to appropriate standards, generally international or national standards, through an unbroken chain of comparisons (Ref. 9)." Traceability typically includes the application of a reference material (RM) or a standard reference material (SRM) for instrument calibration before standardization for the analytes of interest. The **true value** of a measured quantity (τ) cannot typically be determined. The true value is defined as characterizing a quantity that is perfectly defined. It is an ideal value which could be arrived at only if all causes of measurement uncertainty were eliminated, and the entire population was sampled.

Uncertainty

As stated in Section 2, the result of a measurement is only an approximation or estimate of the true value of the measurand or quantity subject to measurement. In the determination of the combined standard uncertainty and ultimately the expanded uncertainty, it is critical to include the uncertainty of calibration in the process, as discussed above. The process of arriving at the uncertainty U_y of a quantity y that is based upon measured quantities $x_i,..,x_z$ is called the propagation of uncertainty. A full discussion of propagation of uncertainty is beyond the scope of this section; a simplified prescription, in the form of general and specific formulae, is provided here. In general, the propagated random uncertainty in y can be determined from:

$$U_y = \sqrt{\left(\frac{\partial y}{\partial x_i} U x_i \right)^2 + \cdots \left(\frac{\partial y}{\partial x_z} U x_z \right)^2}$$

This approach can be used when the uncertainties are random (not systematic), are relatively small, and are independent or uncorrelated (that is, in the absence of covariance). Relatively large uncertainties (such as those approaching the magnitude of the measurand itself) cannot be treated with this approach, especially if the measurand is a nonlinear function of the measured quantity. Note that by convention the use of upper case U_y denotes the expanded uncertainty (which is the uncertainty multiplied by a coverage factor k; for the 95% confidence level, the coverage factor is 2).

It is possible to reduce this general formulation to more specific formulae in the cases of common mathematical operations. These are provided in Table 1.

Table 1: Specific Formulae for the Propagation of Random, Independent Uncertainty

Measurand Argument	Arithmetic Uncertainty Formula
y (where y is a counted random event over a time interval)	$U_y = \sqrt{y}$
$y = A \times x$ (where A is a constant with no uncertainty)	$U_y = \lvert A \rvert \times U_x$
$y = x_1 + x_2$	$U_y = \sqrt{U_{x_1}^2 + U_{x_2}^2}$
$y = x_1/x_2$ $y = x_1 \times x_2$	$\frac{U_y}{\lvert y \rvert} = \sqrt{\left(\frac{U_{x_1}}{x_1}\right)^2 + \left(\frac{U_{x_2}}{x_2}\right)^2}$
$y = (x_1 \times x_2)/x_3$	$\frac{U_y}{\lvert y \rvert} = \sqrt{\left(\frac{U_{x_1}}{x_1}\right)^2 + \left(\frac{U_{x_2}}{x_2}\right)^2 + \left(\frac{U_{x_3}}{x_3}\right)^2}$
$y = \log(x)$	$U_y = \left(\frac{1}{2.303}\right)\left(\frac{U_x}{x}\right)$
$y = \ln(x)$	$U_y = \frac{U_x}{x}$
$y = e^x$	$U_y = y \times U_x$
$y = x^a$	$\frac{U_y}{\lvert y \rvert} = \lvert a \rvert \times \left(\frac{U_x}{x}\right)$
$y = 10^x$	$\frac{U_y}{\lvert y \rvert} = 2.303 \times U_x$

FIGURES OF MERIT

Thomas J. Bruno

In the interpretation of results from a particular technique, one often must evaluate the performance of the measurement on the basis of objective measures that are called figures of merit. The following table provides a description of the more common figures of merit used in analytical chemistry. Even more important than the evaluation of performance is the validation of metrology and the assessment of validation. The same terms used as figures of merit are critical in the validation process. Since many standardization bodies will issue their own definitions regarding these terms, it is not practical to be inclusive; the reader must be aware that other terms may sometimes be substituted for those used here.

Parameter or Metric	Definition	Comments
Accuracy	The deviation of a measured value from the true value (τ), which cannot typically be determined, but which is often approached by use of a standard method under standard conditions.	Can be expressed as: $\text{accuracy} = (x_{av} - \tau)/\tau$, where x_{av} is the mean of a series of measurements.
Precision	The reproducibility of a series of replicate measurements, typically under the same operating conditions in a relatively short period of time.	High precision does not imply high accuracy; reproducibility and repeatability often are used interchangeably, but the former typically refers to precision between two instruments or laboratories.
Sensitivity	Typically the ability to distinguish between small differences in concentration between samples at a desired confidence level.	Often specified by response to a *de facto* or consensus standard; a simple measure is the slope of a calibration curve adjusted for recovery in the sampling process.
Limit of Detection (LOD)	The lowest measureable concentration of an analyte by use of a particular metrology at a desired confidence level.	Typically defined as a response that is some multiplicative factor of the noise level; specified signal to noise ratios of 2 to 4 are typical; as with sensitivity, must adjust for recovery in sample preparation processes.
Linear dynamic range (LDR)	The linear range of a calibration curve obtainable with a particular metrology and analyte.	Within the LDR, the difference in response for two concentrations of a given compound is proportional to the difference in concentration of the two samples.
Selectivity (α)	The ability to distinguish the signal of an analyte from the signal of interferences, the matrix or degradants.	Typically expressed as a ratio, such as the ratio of capacity factors in chromatography; sometimes called specificity.
Analysis Speed	The time required for sample preparation and measurement.	Sometimes necessary to include data processing time.
Throughput	The number of samples that can be run in a given time.	Related to ease of automation, below.
Ease of Automation	The ability of a measurement to be performed without operator attention.	Related to throughput, above, since high throughput typically requires automation. and minimal operator attention.
Ruggedness	The response of an instrument or technique to adverse conditions.	Adverse conditions include extremes in temperature, humidity, dust; includes rough handling; closely related to reproducibility, since it carries similar information content; distinguished from robustness, which is the ability of an instrument to remain unaffected by a small but intentional change in operating parameter, and still perform within specification.
Portability	The ability to use an instrument in other than a fixed location or installation	Can include the ability to use a device in the field in addition to the laboratory.
Environmental Acceptability	The efficiency in terms of low waste generation, low power consumption	Also described as sustainability, and often focused on the minimization of use of hazardous substances.
Economics	The sum of costs required to operate the sample preparation, analysis, and data processing steps of a measurement.	Typically includes the costs of equipment, supplies, labor, utilities and insurance; labor cost must consider the skill level required of personnel.

MASS- AND VOLUME-BASED CONCENTRATION UNITS

Thomas J. Bruno and Paris D. N. Svoronos

A variety of concentration units are used in analytical chemistry, and the most common are provided in this table (Ref. 1). The reference below provides additional details.

Because the mass of one liter of water is approximately one kg, mg/L units of dilute aqueous solution are nearly equal to ppm units. The precise equivalence is obtained by dividing by the density, ρ:

$$\text{ppm} = (\text{mg/L})/\rho$$

where the solution density, ρ, is in g cm^{-3}. Some sources will substitute specific gravity for density in the above equation. The specific gravity is the ratio of the solution density to that of the density of pure water at 4 °C. Since the density of pure water at 4 °C is very nearly 1 g cm^{-3}, the specific gravity is numerically equal (within an uncertainty of 25 ppm) to the solution density when the latter is expressed in units of g cm^{-3}.

Concentration Units Nomenclature

The following table provides guidance in the use of base-10 concentration units (presented in the three preceding tables), since there are differences in usage worldwide.

Number	Number of Zeros	Name (Scientific Community)	Name (United Kingdom, France, Germany)
1000.	3	thousand	thousand
1 000 000.	6	million	million
1 000 000 000.	9	billion	milliard, or thousand million
1 000 000 000 000.	12	trillion	billion
1 000 000 000 000 000.	15	quadrillion	thousand billion

Molar-Based Concentration Units

Molarity*, M: (moles of solute)/(liters of solution)
Molality, *m*: (moles of solute)/(kilograms of solvent)
Normality, N: (equivalents* of solute)/(liters of solution)
Formality, F: (moles of solute)/(kilograms of solution)

* This unit is temperature dependent.

To convert from ppm to formality units:

F = ppm/(1000 *RMM*), where *RMM* is the relative molecular mass of the solute *i*

To convert from ppm to molality units:

m = [ppm/(1000 *RMM*)] [1/(1 – *tds*/1 000 000)]

where *tds* is the total dissolved solids in ppm in the solution

To convert from ppm to molarity units:

M = [ppm/(1000 *RMM*)] ρ

where ρ is the solution density

DETECTION OF OUTLIERS IN MEASUREMENTS

Thomas J. Bruno and Paris D. N. Svoronos

The field of outlier detection and treatment is considerable, and a rigorous mathematical discussion is well beyond any treatment that is possible here. Moreover, the practice in the treatment of analytical results is usually simplified, since the number of observations is often not very large. The two most common methods used by analysts to detect outliers in measured data are versions of the Q-test (Refs. 1–3, 6) and Chauvenet's criterion (Refs. 4–6), both of which assume that the data are sampled from a population that is normally distributed.

Q-Test

To perform the Q-test, one calculates the Q value given by:

$$Q = Q_{gap}/R$$

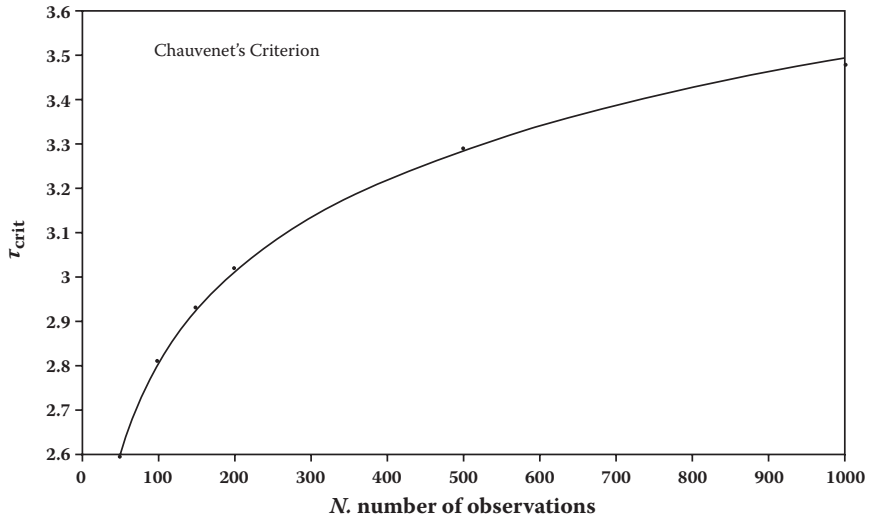
where Q_{gap} is the difference between the suspected outlier and the measured value closest to it, and R is the range of all the measured values in the data set. One then compares the calculated Q value with the critical Q values in the following table:

Number of Observations	Q_{crit}, 90% Confidence Level	Q_{crit}, 95% Confidence Level	Q_{crit}, 99% Confidence Level
3	0.941	0.970	0.994
4	0.765	0.829	0.926
5	0.642	0.710	0.821
6	0.560	0.625	0.740
7	0.507	0.568	0.680
8	0.468	0.526	0.634
9	0.437	0.493	0.598
10	0.412	0.466	0.568

If the calculated value of Q is greater than the appropriate value of Qcrit, then the value is a suspected outlier.

Chauvenet's Criterion

To perform Chauvenet's test on a set of measurements, one first must calculate the mean and standard deviation of the data. Then one calculates:



$$\tau = (x_i - x_{ave})/\sigma$$

where x_i is the suspected outlier, x_{ave} is the mean of all the measurements, and σ is the standard deviation. One then compares the calculated value of τ with τ_{crit} in the following table:

Number of Observations, N	τ_{crit}	Number of Observations, N	τ_{crit}
5	1.65	25	2.33
6	1.73	50	2.57
7	1.81	100	2.81
8	1.86	150	2.93
9	1.91	200	3.02
10	1.96	500	3.29
15	2.12	1000	3.48
20	2.24		

If the calculated value of τ is greater than the value of τ_{crit}, then the value is a suspected outlier.

For numbers of observations between those given in the table, especially for a large number of observations, one may use the following plot to estimate the value of Chauvenet's τ_{crit}:

PROPERTIES OF CARRIER GASES FOR GAS CHROMATOGRAPHY

The following is a list of carrier gases sometimes used in gas chromatography, with properties relevant to the design of chromatographic systems. All data refer to normal atmospheric pressure (101.325 kPa). Additional properties related to the carrier gas, including split ratio, pressure drop in capillary columns, the Martin-James compressibility factor, and the Giddings plate height correction factor can be found in Ref. 2.

M_r: Molecular weight (relative molar mass)
ρ_{25}: Density at 25 °C in g L^{-1}
λ: Thermal conductivity in mW m^{-1} °C^{-1}
η: Viscosity in μPa s (equal to 10^{-3} cP)
c_p: Specific heat at 25 °C in J g^{-1} °C^{-1}

COMMON SYMBOLS USED IN GAS AND LIQUID CHROMATOGRAPHIC SCHEMATIC DIAGRAMS

Thomas J. Bruno

The literature of gas and liquid chromatography frequently contains schematic diagrams that depict analytical apparatus and peripherals. The interpretation of such diagrams can be facilitated by the following graphics that show the most common symbols used to represent chromatographic components.

STATIONARY PHASES FOR POROUS-LAYER OPEN TUBULAR COLUMNS

Thomas J. Bruno and Paris D. N. Svoronos

The practical application of solid adsorbents in capillary chromatography typically makes use of porous-layer open tubular (PLOT) columns. Early capillary PLOT columns suffered from detector spiking due to particulates becoming dislodged and entering the detector. This was resolved by placing a short length of a polymeric column (usually polydimethyl siloxane) as a particle trap before the detector; however, recent advances in manufacturing methods have resulted in nearly complete binding of particles on the inside of the column. In this table, several of the more common PLOT column stationary phases are listed, along with the separations that may be affected and some additional information. The maximum temperatures listed represent the point of severe resolution loss. The materials are often chemically stable to much higher temperatures. The user should also be aware that the adsorption of water during use will often change retention characteristics dramatically, sometimes resulting in a reversal of positions of adjacent peaks. This can result from traces of water in the carrier gas. Due to surface adsorption of solutes, some experimentation with temperature may be necessary to prevent tailing or to avoid statistical correlation (or a propagating error) among replicate analyses (Ref. 5). Note that PLOT columns have been used in HPLC for the separation of large molecules such as proteins; this table is limited to smaller molecules.

Phase	Max. temp. /°C	Separation affected	Notes
Silica gel	250	H_2, Air, CO, C_1 to C_4 normal hydrocarbons, alkenes and alkynes, inorganic gases, volatile ethers	Very hydrophilic; requires activation; can be unpredictable; largely replaced by porous polymers; bonded versions are suitable for use with GC-MS, because of the absence of particles.
Alumina, deactivated with KCl	250	C_1 to C_8 hydrocarbons, especially useful for resolution of propadiene and butadiene from ethylene and propylene	Least polar of the alumina phases; lowest retention of olefins relative to the corresponding paraffin; specified in many standard methods.
Alumina, deactivated with Na_2SO_4	250	C_1 to C_8 hydrocarbons, resolves acetylene from butane and propylene from isobutane	Medium and high polarity phases are available among the alumina phases; specified in many standard methods.
Cyclodextrins	260	Light hydrocarbons (C_1 to C_{10}) and halocarbons	α- and β-cyclodextrins have been used; care should be taken with halocarbon analysis, due to the potential of HF contamination of the sample. See the information on cyclodextrin phases in Reference 5.
Styrene – divinylbenzene	250	C_1 to C_3 hydrocarbons; paraffins up to C_{12}; CO from air, ethers, sulfur gases, water	See the information on porous polymers in Reference 5.
Divinylbenzene ethylene glycol dimethacrylate	280	C_1 to C_7 hydrocarbon isomers; CO_2, CH_4, amines, common solvents, alcohols, aldehydes, ketones	More polar than styrene – divinyl benzene phases.
Molecular sieve, 5A	350	Air and light gas analysis; H_2, O_2, N_2, (CH_4, CO, NO, SF_6 coelute); thick film phase can resolve Ar from O_2 at 35 °C; deuterated hydrocarbons	Synthetic calcium alumino-silicate (zeolite) having an effective pore diameter of 0.5 nm CO_2 is adsorbed strongly; 5A usually gives the best results of all synthetic zeolites; thick and thin film columns are available.
Molecular sieve, 13X	350	Same separations as those performed on 5A, but with C_1 to C_4, alkanes, alkenes, and alkynes being separated as well	Sodium alumino-silicate (zeolite), having a larger pore size than 0.5 nm, thus producing lower retention times and less resolution; 28.6% (mass/mass) water capacity.
Monolithic carbon	350	C_1 to C_5 hydrocarbon isomers; acetylene in ethylene; methane	Phase consists of a bonded carbon monolith; historically more suitable for use with GC-MS, because of the absence of particles.

COOLANTS FOR CRYOTRAPPING

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides fluids (in some cases mixtures) that can be used to chill trapping sorbents (or any cold trap) for the purge and trap sampling of solutes (Refs. 1–4). In each case the ratio is mass/mass. Practical use of these methods can require optimization and proper insulation.

PROPERTIES OF COMMON CROSS-LINKED SILICONE STATIONARY PHASES

Thomas J. Bruno and Paris D. N. Svoronos

Modern gas chromatography is most often performed with high efficiency capillary (open tubular) columns coated with a cross-linked polymeric stationary phase. We provide chromatographic data on the two most common cross-linked phases (Ref. 1). These data are useful for the interpretation of chromatograms, and for quality control and assurance. The retention indices presented in these tables were measured at 120 °C isothermally. Retention indices are temperature dependent; the temperature dependence of the Kovats indices have been studied for many compounds (Ref. 2). For more extensive information on other cross-linked phases, other silicone phases, mesogenic phases, and solid sorbents, the reader is advised to consult Ref. 1.

Phase: 5% Phenyl Dimethylpolysiloxane

Temperature Ranges:

–60 °C to 325 °C isothermally, –60 °C to 350 °C programmed for < 0.32 mm I.D. columns
–60 °C to 300 °C isothermally, –60 °C to 320 °C programmed for 0.53 mm I.D. columns
–60 °C to 260/280 °C for >2.0 µm films

Similar Phases:

DB-5, Ultra-2, SPB-5, CP-Sil 8 CB, Rtx-5, BP-5, OV-5, 007-2 (MPS-5), SE-52, SE-54, XTI-5, PTE-5, HP-5MS, ZB-5, AT-5, MDN-5

Notes: This phase is probably the most commonly used stationary phase in gas chromatography, because it combines boiling point separation with a minor contribution of a specific interaction; typically used as the first phase in any method development; versatile for hydrocarbons and more polar compounds.

Probe compound	McReynolds constant	McReynolds code	Kovats retention index
Hexane			600
1-Butanol	66	y'	656
Benzene	31	x'	684
2-Pentanone	61	z'	688
Heptane			700
1,4-Dioxane	64	L	718
2-Methyl-2-pentanol	41	H	731
1-Nitropropane	93	u'	745
Pyridine	62	s'	761
Octane			800
Iodobutane	22	J	840
2-Octyne	35	K	876
Nonane			900
Decane			1000

Phase: Dimethylpolysiloxane

Temperature Ranges:

–60 °C to 325 °C for normal operations, periodic operation to 350 °C can be used to facilitate column clean-up
–60 °C to 260/280 °C for >2.0 µm films

Similar Phases:

DB-1, OV-1, HP-1, DB-1ms, HP-1ms, Rtx-1, Rtx-1ms, CP-Sil 5 CB Low Bleed/MS, MDN-1, AT-1

Notes: Useful for the separation of hydrocarbons, pesticides, PCBs, phenols, sulfur compounds, flavors and fragrances, and some amines; columns are typically stable and low bleed; a good all-purpose column used to begin method development protocols.

Probe compound	McReynolds constant	McReynolds code	Kovats retention index

Detector	Limit of detection	Linearity	Selectivity	Comments
Thermal conductivity detector (TCD, katharometer)	1×10^{-10} g propane (in helium carrier gas)	1×10^{6}	Universal response, concentration detector	Ultimate sensitivity depends on analyte thermal conductivity difference with carrier gas Since thermal conductivity is temperature dependent, response depends on cell temperature Wire selection depends on chemical nature of analyte Helium is recommended as carrier and make-up gas When analyzing mixtures containing hydrogen, one can use a mixture of 8.5% (mass/mass) hydrogen in helium
Gas density balance detector (GADE)	1×10^{-9} g: H_2 with SF_6 as carrier gas	1×10^{6}	Universal response, concentration detector	Response and sensitivity are based on difference in relative molecular mass of analyte with that of the carrier gas; approximate calibration can be done on the basis of relative density The sensing elements (hot wires) never touch sample, thus making GADE suitable for the analysis of corrosive analytes such as acid gases; gold sheathed tungsten wires are most common Best used with SF_6 as a carrier gas, switched between nitrogen when analyses are required Detector can be sensitive to vibrations, and should be isolated on a cushioned base
Flame ionization detector (FID)	1×10^{-11} g to 1×10^{-10} g	1×10^{7}	Organic compounds with C–H bonds	Ultimate sensitivity depends on the number of C–H bonds on analyte Nitrogen is recommended as carrier gas and make-up gas to enhance sensitivity Sensitivity depends on carrier make-up and jet gas flow rates Column must be positioned 1 mm to 2 mm below the base of the flame tip Jet gases must be of high purity
Nitrogen-phosphorus detector (NPD, thermionic detector, alkali flame ionization detector)	4×10^{-13} g to 1×10^{-11} g of nitrogen compounds 1×10^{-13} g to 1×10^{-12} g of phosphorus compounds	1×10^{4}	10^{5} to 10^{6} by mass selectivity of N or P over carbon	Does not respond to inorganic nitrogen such as N_2 or NH_3 Jet gas flow rates are critical to optimization Response is temperature dependent Used for trace analysis only, and is very sensitive to contamination Avoid use of phosphate detergents or leak detectors Avoid tobacco use nearby Solvent-quenching is often a problem
Electron capture detector (ECD)	5×10^{-14} g to 1×10^{-12} g	1×10^{4}	Selective for compounds with high electron affinity, such as chlorinated organics; concentration detector	Sensitivity depends on number of halogen atoms on analyte Used with nitrogen or argon/methane (95/5, mass/mass) carrier and make-up gases Carrier and make-up gases must be pure and dry The radioactive ^{63}Ni source is subject to regulation and periodic inspection
Flame photometric detector (FPD)	2×10^{-11} g of sulfur compounds 9×10^{-13} g of phosphorous compounds	1×10^{3} for sulfur compounds 1×10^{4} for phosphorous compounds	10^{5} to 1 by mass selectivity of S or P over carbon	Hydrocarbon quenching can result from high levels of CO_2 in the flame Self-quenching of S and P analytes can occur with large samples Gas flows are critical to optimization Response is temperature dependent Condensed water can be a source of window fogging and corrosion

Detector	Limit of detection	Linearity	Selectivity	Comments
Photoionization detector (PID)	1×10^{-12} g to 1×10^{-11} g	1×10^{7}	Depends on ionization potentials of analytes	Used with lamps with energies of 10.0 eV to 10.2 eV Detector will have response to ionizable compounds such as aromatics and unsaturated organics, some carboxylic acids, aldehydes, esters, ketones, silanes, iodo- and bromoalkanes, alkylamines and amides, and some thiocyanates
Sulfur chemiluminescence detector (SCD)	1×10^{-12} g of sulfur in sulfur compounds	1×10^{4}	10^{7} by mass selectivity of S over carbon	Equimolar response to all sulfur compounds to within 10% Requires pure hydrogen and oxygen combustion gases Instrument generates ozone *in situ*, which must be catalytically destroyed at detector outlet Catalyst operates at 950 °C to 975 °C Detector operated at reduced pressure (10^{-3} Pa)
Electrolytic conductivity detector (ECD, Hall detector)	10×10^{-13} g to 1×10^{-12} g of chlorinated compounds: 2×10^{-12} g of sulfur compounds: 4×10^{-12} g of nitrogen compounds	1×10^{6} for chlorinated compounds, 10^{4} for sulfur and nitrogen compounds	10^{6} by mass selectivity of Cl over carbon, 10^{5} to 10^{6} by mass selectivity of S and N over carbon	Only high purity solvents should be used Carbon particles in conductivity chamber can be problematic Frequent cleaning and maintenance is required Often used in conjunction with a photoionization detector For chlorine, use hydrogen as the reactant gas and 1-propanol as the electrolyte For nitrogen or sulfur, hydrogen or oxygen can be used as reactant gas, and water or methanol as the electrolyte Ultrahigh purity reactant gases are required
Ion mobility detector (IMD)	1×10^{-12} g	1×10^{3} to 1×10^{4}	10^{3}	Amenable to use in handheld instruments Linear dynamic range of 10^{3} for radioactive sources and 10^{5} for photoionization sources Selectivity depends on mobility differences of ions Has been used for a wide variety of compounds including amino acids, halogenated organics, explosives The radioactive ^{63}Ni source is subject to regulation and periodic inspection
Mass selective detector (MSD, mass spectrometer, MS)	1×10^{-11} g (single ion monitoring); 1×10^{-8} g (scan mode)	1×10^{5}	Universal	Single quadrupole, multiple quadrupole, ion trap, time of flight and magnetic sector instruments available (see separate table entitled: "Varieties of Hyphenated Gas Chromatography with Mass Spectrometry") Must operate under moderate vacuum (1×10^{-4} Pa) Requires a molecular jet separator to operate with packed columns Amenable to library searching for qualitative identification Requires tuning of electronic optics over the entire m/e range of interest
Infrared detector (IRD)	1×10^{-9} g of a strong infrared absorber	1×10^{3}	Universal for compounds with mid-infrared active functionality	A costly and temperamental instrument that requires high purity carrier gas, a nitrogen purge of optical components (purified air will, in general, not be adequate) Must be isolated from vibrations Presence of carbon dioxide is a typical impurity band at 2200 cm^{-1} to 2300 cm^{-1} Requires frequent cleaning and optics maintenance Amenable to library searching for qualitative identification
Atomic emission detector (AED)	1×10^{-13} g to 2×10^{-11} g of each element	1×10^{3} to 1×10^{4}	10^{3} to 10^{5}, element to element	Requires the use of ultra high purity carrier and plasma gases Plasma produced in a microwave cavity operated at 2450 MHz Scavenger gases (H_2, O_2) are used as dopants Photodiode array is used to detect emitted radiation

VARIETIES OF HYPHENATED GAS CHROMATOGRAPHY WITH MASS SPECTROMETRY

Thomas J. Bruno

Because of the very powerful and common application of mass spectrometry with gas chromatography, the various technologies warrant more detailed consideration (Refs. 1 to 4). The following table provides basic information on the capabilities and applicability of the most common approaches. Clearly, the use of the single quadrupole is by far the most prevalent and economical method, but the other techniques are important and advantageous. We exclude methods that are typically not interfaced with gas chromatographic separations and that are highly specific in research settings (such as ion cyclotron mass spectrometry, and combined quadrupoles beyond the triple quad, and the various hybrid sector-quad-time of flight-ion trap combinations) that are used in fundamental ion chemistry research. We also exclude magnetic sector instruments that are seldom used with chromatography.

Method (with accepted acronyms and abbreviations)	Modes	Advantages	Limitations
Gas Chromatography Mass Spectrometry GC-MS (single quadrupole, SQ)	Scan, selected ion monitoring (SIM) and Scan/SIM	Relatively simple and relatively inexpensive; compound identification by library search; dynamic range = 10^5, but typically limited to $>10^4$; mass/charge range = 10^3 to 10^4, resolution (at m/z = 1000) 10^3 to 10^4 for most ions; well-developed hardware and software; used in standard protocols.	Coelution of compounds compromise library identifications; often user must interpret fragmentation patterns. SIM mode provides higher sensitivity but for target ions only, sensitivity decreases with increasing number of SIM ions. Scan/SIM methods must balance scan and SIM sensitivity requirements.
Gas Chromatography-Mass Spectrometry GC-MS (ion trap, IT)	Scan or selected ion monitoring (SIM); tandem MS-MS; gas or liquid chemical ionization	High sensitivity, compact design, tandem mass spectrometry is possible; dynamic range = 10^4, but typically limited to $< 10^4$; mass/charge range = 10^4 to 10^5, resolution (at m/z = 1000) 10^4; well-developed hardware and software; used in standard protocols.	Space charge effects can lead to relatively poor dynamic range, however, for "clean" samples, the dynamic range can be as high as single quadrupole units; specific libraries are limited; SIM is for target ions only with a sensitivity lower than that obtainable by a SIM analysis via single quadrupole, above; MS-MS analyses are limited to approximately 120 to 150 compounds per analysis; MS-MS analysis is typically slower than that done with a tandem MS-MS (process is done in time rather than space).
Gas Chromatography (time of flight) Mass Spectrometry, low resolution GC-TOF	Scan or selected ion monitoring	Identification possible with good chromatographic separations, dynamic range = 10^4, mass/charge range = 10^5, resolution (at m/z = 1000) 10^3 to 10^4.	Unit mass resolution limits identification capability; libraries are limited; if chromatographic separation is poor, comprehensive (GCXGC) might be needed; cannot distinguish neutral losses.
Comprehensive Gas Chromatography (time of flight) Mass Spectrometry, low resolution GCXGC-TOF	Scan or selected ion monitoring; normal column configuration (nonpolar – polar) or reversed column configuration (polar – nonpolar)	Identification possible with good chromatographic separations in two dimensions on a nonpolar (long) and a polar (short) column; identification of families with help of principal component analysis tools; dynamic range = 10^4, mass/charge range = 10^5, resolution (at m/z = 1000) 10^3 to 10^4, well-developed hardware and software; used in standard protocols.	Unit mass resolution limits identification capability; libraries are limited; GCXGC may not remedy all aspects of component coelution.

Method (with accepted acronyms and abbreviations)	Modes	Advantages	Limitations
Gas Chromatography Mass Spectrometry (triple quadrupole) GC-MS(QQQ, or QqQ)	Multiple and selected reaction monitoring	Provides product and precursor ion scans; very sensitive for target compounds or functional groups; developed to provide enhanced daughter ion resolution; relatively simple construction with straightforward scanning procedures; no high voltage arcing; dynamic range = 10^5, mass/charge range = 10^3 to 10^4, resolution (at m/z = 1000) 10^3 - 10^4.	Unit mass, making identification ambiguous due to multiple structures as source of breakdown mass; empirical formula determination can be difficult, spectra and fragmentations must often be interpreted manually; full scan data can be acquired (similar to the single quad procedure) by turning off the collision cell.
Gas Chromatography (time of flight) Mass Spectrometry, high resolution GC-TOF	Scan or selected ion monitoring, tandem MS-MS	Might obviate the need for GCXGC separations with accurate mass determinations; deconvolution software can aid in identification of multiple components under peaks; sensitivity intermediate between multiple reaction monitoring and product ion scan of a QQQ; dynamic range = 10^4, mass/charge range = 10^5, resolution (at m/z = 1000) 10^3 to 10^4.	Very large data files (currently approaching 2 Gb), software is currently developmental.
Gas Chromatography Tandem Mass Spectrometry GC-QTOF	Scan or selected ion monitoring, tandem MS-MS	Might obviate the need for GCXGC separations with accurate mass determinations; isolation of parent ions and subsequent fragmentation provides identification; will detect any daughter ion passed into the TOF; sensitivity intermediate between multiple reaction monitoring and product ion scan of a QQQ dynamic range = 10^4, mass/charge range = 10^5, resolution (at m/z = 1000) 10^3 to 10^4.	Large data files are produced; Sophisticated software is needed for processing and deconvolution; requires accurate mass and high resolution.

SOLID-PHASE MICROEXTRACTION SORBENTS

Thomas J. Bruno and Paris D. N. Svoronos

While trapping sorbents have been used for many years in headspace analysis (most commonly with gas chromatography), the modern techniques of solid-phase microextraction (SPME) are particularly applicable to survey analyses (Ref. 1). In the following tables, we provide information for the selection and application of the various fibers, modifications to fiber materials, and data on salting out reagents (Refs. 1 to 5). For information on other trapping sorbents, chelating agents, resins, and polymeric phases used for headspace analysis, please consult Ref. 1.

Fiber Selection Criteria

The main fiber selection parameters are polarity and relative molecular mass. The table below provides general guidelines on the applicability of available fibers relative to these two parameters. The fibers are characterized by the extraction mechanism, either adsorption or absorption. Adsorbent fibers contain particles suspended in polydimethyl siloxane (PDMS) or polyethylene glycol (PEG, Carbowax).

Fiber	Type of Fiber	Polarity	*RMM* Range
7 µm PDMS	Absorbent	Nonpolar	150–700
30 µm PDMS	Absorbent	Nonpolar	80–600
85 µm Polyacrylate	Absorbent	Moderately polar	60–450
100 µm PDMS	Absorbent	Nonpolar	55–400
50 µm Carbowax (PEG)	Adsorbent	Polar	50–400
PDMS-DVB	Adsorbent	Bipolar	50–350
Carbowax-DVB	Adsorbent	Polar	50–350
PDMS-DVB-Carboxen	Adsorbent	Bipolar	40–270
PDMS-Carboxen	Adsorbent	Bipolar	35–180
Carbopak Z-PDMS	Adsorbent	Nonpolar	50–500

PDMS – Polydimethylsiloxane
DVB – Divinylbenzene (3 µm to 5 µm particles)
PEG – Polyethylene glycol
Carboxen – Carboxen 1006 (contains micro-, meso-, and macro-tapered pores) (3 µm to 5 µm particles)

***RMM* Range** – Relative molecular mass range that is the ideal range for optimum extraction. Ranges can be extended by varying extraction times, but results will not be optimized

Phase Material Characteristics

Polydimethylsiloxane (PDMS):
Similar in properties to the OV-1 or SE-30 silicone phases (Ref. 1); non-polar fluid suitable for non-polar or slightly polar analytes; thicker coatings extract more analyte, but require longer extraction times; thicker coatings may show carryover effects; useful for hydrocarbons, aldehydes, ketones, and esters.

Polyacrylate:
Rigid solid material; moderate polarity; diffusion of analytes through bulk is relatively slow because of rigidity of material; relatively higher desorption temperatures required because of rigidity of material; can be oxidized easily at higher temperatures; must use oxygen-free carrier gas and ensure gas chromatographic system is leak-free; fibers are very solvent resistant; darkens to a brown color upon exposure to temperatures in excess of 280 °C, but fiber is generally still usable until color becomes black; useful for alcohols.

Carbowax (polyethylene glycol, PEG):
Similar in properties to the PEG coatings used extensively in chromatography; moderately polar; highly crosslinked to counteract water solubility; sensitive to attack by oxygen at temperatures in excess of 220 °C, at which point the fiber will darken and become powdery; requires use of high purity carrier gas (typically He at 99.999 % mass/mass) treated for oxygen contamination.

Divinylbenzene (DVB):
Similar to the properties of divinylbenzene porous polymer phases; higher polarity than Carbowax, and when combined with Carbowax results in a more polar phase; like polyacrylate, it is a solid particle that must be carried in a liquid to coat on a fiber.

Carboxen:
Similar to the material used in Carboxen porous-layer open tubular (PLOT) columns; structure has an approximately even distribution of macro-, meso-, and micro-pores, making it valuable for smaller analytes; larger analytes can show hysteresis that must be addressed by desorption at 280 °C; useful for hydrocarbons, ethers, aldehydes, and ketones.

Extraction Capability of Solid-Phase Microextraction Sorbents

This table shows the extraction capability of the fibers for acetone, a small, moderately polar analyte, for 4-nitrophenol, a medium size polar analyte, and benzo(GHI)perylene, a large nonpolar analyte. This provides a general guideline for fiber selection.

Fiber	Approx. Linear Conc. Range Acetone 10 min Ext[a] (FID)	Approx. Linear Conc. Range 4-Nitrophenol 20 min Ext[b] (GC/MS)	Approx. Linear Conc. Range Benzo(GHI) Perylene 20 min Ext
7 µm PDMS	100 ppm and up	Not extracted	100 ppt to 500 ppb
30 µm PDMS	10 ppm and up	10 ppm and up	100 ppt to 10 ppm
85 µm Polyacrylate	1 ppm to 1000 ppm	5 ppb to 100 ppm	500 ppt to 10 ppm
100 µm PDMS	500 ppb to 1000 ppm	500 ppb to 500 ppm	500 ppt to 10 ppm
50 µm Carbowax (PEG)	1 ppm to 1000 ppm	5 ppb to 50 ppm	25 ppb to 10 ppm
PDMS-DVB	50 ppb to 100 ppm	25 ppb to 10 ppm	10 ppb to 1 ppm
Carbowax-DVB	100 ppb to 100 ppm	5 ppb to 10 ppm	50 ppb to 5 ppm
PDMS-DVB-Carboxen	25 ppb to 10 ppm	50 ppb to 10 ppm	100 ppb to 1 ppm poorly desorbed
PDMS-Carboxen	5 ppb to 5 ppm	100 ppb to 10 ppm	Not desorbed
Carbopak Z-PDMS	10 ppm to 500 ppm	5 ppm to 100 ppm	500 ppt to 100 ppb

Note: In each case, the concentration is expressed on a mass basis (e.g., ppm mass/mass).
[a] Water sample contains 25% NaCl (mass/mass)
[b] Water sample contains 2% NaCl (mass/mass) acidified to pH = 2 with 0.05 M phosphoric acid
1 ppm = 1 part in 1×10^6
1 ppb = 1 part in 1×10^9
1 ppt = 1 part in 1×10^{12}

Typical Phase Volumes of SPME Fiber Coatings

Fiber Coating Thickness/Type	Type of Fiber Core	Fiber Core Diameter/mm	Phase Volume/mm^3 or µL
PDMS	Fused silica	0.110	0.612
100 µm PDMS	Metal	0.130	0.598
30 µm PDMS	Fused silica	0.110	0.132

DVB layer		0.190	0.377
60 µm PDMS-DVB HPLC	Proprietary	0.160	0.459

Bonded-Phase Modified Silica Substrates for Solid-Phase Extraction

The following table provides the most commonly used bonded-phase modified silica substrates used in solid-phase extraction (Ref. 6). Additional information on many of these materials can be found in the table entitled "More Common HPLC Stationary Phases" in the HPLC chapter of Ref. 2.

Phase	Polarity of Phase	Designation
Octadecyl, endcapped	Strongly apolar	C18ec
Octadecyl	Strongly apolar	C18
Octyl	Apolar	C8
Ethyl	Slightly polar	C2
Cyclohexyl	Slightly polar	CH
Phenyl	Slightly polar	PH
Cyanopropyl	Polar	CN
Diol	Polar	2OH
Silica gel	Polar	SiOH
Carboxymethyl	Weak cation exchanger	CBA
Aminopropyl	Weak anion exchanger	NH_2
Propylbenzene sulfonic acid	Strong cation exchanger	SCX
Trimethylaminopropyl	Strong anion exchanger	SAX

Salting-Out Reagents for Headspace Analysis

The following table provides data on the common salts used for salting out in chromatographic headspace analysis, as applied to direct injection methods and to solid-phase microextraction. Data are provided for the most commonly available salts, although others are possible. Sodium citrate, for example, occurs as the dihydrate and the pentahydrate. The pentahydrate is not as stable as the dihydrate, however, and dries out on exposure to air, forming cakes. Potassium carbonate occurs as the dihydrate, trihydrate, and sesquihydrate; however, data are provided only for the anhydrous material. The solubility is provided as the number of grams that can dissolve in 100 mL of water at the indicated temperature. The vapor enhancement cited is the degree of increase of the concentration of vapor over the solution of a 2 % (mass/mass) ethanol solution in water at 60 °C.

Salt	Formula	Rel. Mol. Mass	Density/g cm^{-3}	Solubility/g mL^{-1} H_2O		Vapor Enhancement
				Cold Water	Hot Water	
Potassium carbonate	K_2CO_3	138.21	2.428 at 14 °C	112[a]	156[b]	8
Ammonium sulfate	$(NH_4)_2SO_4$	132.13	1.769 at 50 °C	70.6[c]	103.8[b]	5
Sodium citrate (dihydrate)	$Na_3C_6H_5O_7 \times 2H_2O$	294.10		72[d]	167[b]	5
Sodium chloride	NaCl	58.44	2.165[e]	37.5[a]	39.12[b]	3
Ammonium chloride	NH_4Cl	53.49	1.527	29.7[c]	75.8[b]	2

[a] 20 °C
[b] 100 °C
[c] 0 °C
[d] 25 °C
[e] Specific gravity, 25 °C/4 °C

GAS CHROMATOGRAPHIC RETENTION INDICES

Thomas J. Bruno

The interpretation of results from chromatographic measurements can often be augmented with an appropriate mathematical treatment of the solute retention that is observed. The goal of the treatment is to make the resulting metric as independent of the instrument as possible. A typical situation that arises from analysis by gas chromatography with mass spectrometry is that the library search routine produces "hits" that are ambiguous if not nonsensical (Ref. 1). The correct interpretation of the mass spectrum must then be done manually (Refs. 2, 3), and the mass spectral data should be augmented by additional analytical techniques. The specific techniques that should be used must be determined on a case-by-case basis by a qualified person. One additional datum that is typically already present in gas chromatography with mass spectrometry detection is chromatographic retention. The raw datum from a chromatographic measurement is a retention time, t_r, of each eluted peak, and a corresponding intensity. Here, we will not treat other aspects of the output, such as the width and shape of the chromatographic signal. The retention time (for a given stationary phase) is dependent on the column temperature, column pressure, column geometry (length and inside diameter; phase ratio), and ambient (atmospheric) pressure.

If the volumetric carrier gas flow rate (at the column exit) is measured and multiplied by the retention time, the retention volume, V_R, is obtained. The adjusted retention volume, V_R', is the retention volume corrected for the void volume (or mobile phase holdup) of the column. It is obtained by simply subtracting the retention volume of an unretained solute (V_M):

$$V_R' = V_R - V_M. \tag{1}$$

While it is possible to calculate the corresponding adjusted retention time, t_r', by subtracting the retention time of the unretained peak, t_m, it is better to work with volumes since average flow-rate variations between individual analyses are then accounted for. Note that with each level of refinement beyond the raw retention time, a facet of instrument dependence from the resulting parameter is removed. V_R is independent of the flow rate; V_R' is, further, independent of column geometry. Continuing with this approach, the net retention volume, V_N, is defined, by applying a factor, j, to account for the pressure drop across the column:

$$V_N = jV_R', \tag{2}$$

where j is usually the Martin-James compressibility factor[3]:

$$j = \frac{3}{2}\left[\frac{\left(\frac{P_i}{P_o}\right)^2 - 1}{\left(\frac{P_i}{P_o}\right)^3 - 1}\right] \tag{3}$$

In Eq. 3, P_i is the inlet pressure (absolute) and P_o is the outlet pressure (usually atmospheric pressure). The net retention volume is important because it is independent of the inlet and outlet pressures, as well as being independent of the carrier gas flow rate and column geometry.

The specific retention volume, V_g, corrects the net retention volume for the amount of stationary phase actually on the column, and the column temperature is adjusted or corrected to 0 °C:

$$V_g = (273.15)\frac{V_N}{(W_s T_{col})} \tag{4}$$

where T_{col} is the column temperature (in K), and W_s is the mass of the stationary phase in the column. The V_g value is a characteristic for a particular solute on a particular stationary phase, and is instrument independent. This is a quantity that may be compared from instrument to instrument, and laboratory to laboratory with a high level of confidence provided the stationary phase used is a single, pure compound or a well characterized mixture. If the mass of the stationary phase is not known, or is not meaningful, one may use the net retention volume directly, or one may correct the net retention volume to a column temperature of 0 °C (represented by V_N^0) by simply not including the term for W_s (that is, setting it equal to unity).

It is also extremely valuable to calculate a relative retention, $r_{a/b}$:

$$r_{a/b} = \left(\frac{V_g^b}{V_g^a}\right) = \left(\frac{V_N^b}{V_N^a}\right) \tag{5}$$

where the numerical superscripts refer to the retention volumes of solutes "a" and "b." In this case, solute "a" is a reference compound. The relative retention is dependent only on the column temperature and the type of stationary phase. For reasons of operational simplicity, this parameter is usually one of the best to use for qualitative analysis. It can account for small differences in the column temperature, stationary phase considerations, column history, and minor disturbances in the carrier gas flow rate. It is possible to account for the column temperature by plotting the logarithm of the retention parameters against $1/T$, where T is the thermodynamic temperature. The column pressure is accounted for by variations in the volume measurement; therefore, there is no pressure dependence to these parameters.

We can go beyond the simple retention parameters discussed earlier to incorporate a logarithmic interpolation on a uniform scale by use of the Kovats retention index (Ref. 4). The isothermal Kovats retention index is calculated by use of the following defining equation:

$$I_{sample}(T) = 100\left[\frac{\log X_S - \log X_L}{\log X_H - \log X_L} + n_L\right] \tag{6}$$

Here, I_{sample} is the dimensionless Kovats retention index that is a function of both temperature and the stationary phase employed. The terms represented by X are retention parameters of the sample and standards. Following this convention, X_S is the retention parameter of the sample under consideration. Any retention parameter, such as the adjusted retention time, t', the net retention volume, V_N, the adjusted net retention volume, V_N^0, and the relative retentions, $r_{a/b}$, can be used. X_S is the retention parameter of the sample under consideration, X_L is the retention parameter of a normal alkane (that is, straight chain or unbranched) of carbon number n_L that elutes earlier than the sample, and X_H is the retention parameter of a normal alkane having a carbon number greater than n_L+1 that elutes after the sample. The retention index of a sample is, therefore, 100 multiplied by the carbon number of a hy-

pothetical normal alkane that shows the same retention parameter on the stationary phase at that temperature. Thus, a sample that has a retention index of 785, for example, would coelute with a hypothetical normal alkane that has 7.85 carbon atoms. By definition, the retention indices of the normal alkanes (on any stationary phase) are equal to 100 multiplied by the carbon number. Thus, for *n*-hexane, $I = 600$, and so on for the other *n*-alkanes in this homologous series. The zero point in the scale is defined for hydrogen, for which $I = 0$. Kovats retention indices have been determined for selected compounds on the most common stationary phases [Refs. 5-7].

The temperature dependence of I for a given sample is known to follow a hyperbolic form similar to the familiar Antoine equation used to represent vapor pressure:

$$I_{\text{sample}}(T) = A + \frac{B}{(T + C)} \tag{7}$$

In this equation, A, B, and C are empirically determined constants, and T is the temperature (in °C). A nonlinear fitting routine should be used to determine these constants. When retention indices are available for at least three temperatures, initial values for A, B, and C can be determined by use of the following equations:

$$C = \frac{(T_2 - T_1)(I_3T_3 - I_1T_1) + (T_3 - T_1)(I_1T_1 - I_2T_2)}{(T_3 - T_1)(I_2 - I_1) - (T_2 - T_1)(I_3 - I_1)}, \tag{8}$$

$$A = \frac{I_2T_2 - I_1T_1 + C(I_2 - I_1)}{T_2 - T_1}, \tag{9}$$

$$B = (I_2 - A)(T_2 + C). \tag{10}$$

In these equations, I_1, I_2, and I_3 are retention indices of the sample measured at temperatures T_1, T_2, and T_3. When additional retention indices are available at other temperatures, we advocate the use of minimum deviation estimates from these three equations to furnish the starting values for the nonlinear fit. When retention indices at four temperatures are available, the best starting values are obtained from the I_1, I_2, and I_3 triplet that minimizes the deviation with the experimental value with that produced by Eq. 7. This approach provides the fastest convergence, and also helps avoid converging to local minima. Predictions made by use of Eq. 7 can be used for retention indices within the measured temperature range as well as extrapolation somewhat beyond that range on a case-by-case basis.

It is also of value to report and use the temperature dependence as a slope coefficient, $\delta I_{\text{sample}}/10$ °C, the variation of I_{sample} for a particular stationary phase over a particular temperature range. While not as reliable as the Antoine-type fit, this coefficient is useful for predictions within the range of the measured results.

In all of the above discussion, one must understand that the column temperature is fixed. The Kovats retention indices can be made applicable to temperature programmed analysis by use of

$$I = 100 \times \left[n + (N - n) \frac{t_{r(\text{unknown})} - t_{r(n)}}{t_{r(N)} - t_{r(n)}} \right], \tag{11}$$

where I is the retention index, n is the number of carbon atoms in the smaller *n*-alkane, N is the the number of carbon atoms in the larger *n*-alkane, and t_r is the retention time of the indicated peak.

A useful alternative to the Kovats system is the Lee retention index (isothermal and temperature dependent), based on the polynuclear aromatic hydrocarbon (PAH) standard compounds: naphthalene ($I = 200$), phenanthrene ($I = 300$), chrysene ($I = 400$), and picene or benzo(g,h,i)perylene ($I = 500$). Isothermal (and temperature-dependent) Kovats and Lee retention indices for many compounds are tabulated in the NIST Chemistry Web Book (Ref. 8).

ELUOTROPIC VALUES OF SOLVENTS ON OCTADECYLSILANE AND OCTYLSILANE

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides, for comparative and interpretive purposes, eluotropic values on bonded octadecylsilane (ODS) and octylsilane (OS) for common solvents used in HPLC (Refs. 1–3). For additional information on common, specific and chiral stationary phases for HPLC, and for solvents, derivatizing reagents, and detectors, see Ref. 3.

Tetrahydrofuran	3.7	—

INSTABILITY OF HPLC SOLVENTS

Thomas J. Bruno and Paris D. N. Svoronos

Solvents that are commonly used in high performance liquid chromatography frequently have inherent chemical instabilities that must be considered when designing an analysis, or in the interpretation of results (Refs. 1-4). In many cases, such solvents are obtainable with stabilizers added to control the instability or to slow the reaction. Reactive solvents that do not have stabilizers must be used quickly or be given proper treatment. In either case, it is important to understand that the solvents (as they may be used in an analysis) are not necessarily pure materials.

Although not specifically considered below, the preparation of aqueous-organic solvents for HPLC can cause the introduction of impurities. Mixing acetonitrile and water is endothermic and can sometimes exacerbate air dissolution. Buffers are also a special case in that the pH can change due to exposure to air and the development of microbes (Ref. 4). Buffers should be used the same day of preparation and often incorporate the preservative sodium metabisulfite.

Solvent	Contaminants, reaction products	Stabilizers
Ethers		
Diethyl ether	Peroxides[1]	2–3% (vol/vol) ethanol[2] 1–10 ppm (mass/mass) BHT[3] (1.5–3.5% ethanol) + (0.2–0.5% water) + (5–10 ppm (mass/mass) BHT[3])
Isopropyl ether	Peroxides[1]	0.01% (mass/mass) hydroquinone 5–100 ppm (mass/mass) BHT[3]
1,4-Dioxane	Peroxides[1]	25–1500 ppm (mass/mass) BHT[3]
Tetrahydrofuran	Peroxides[1]	25–250 ppm (mass/mass) BHT[3]
Chlorinated Alkanes		
Chloroform	Hydrochloric acid, chlorine, phosgene (CCl_2O)	0.5–1% (vol/vol) ethanol 50–150 ppm (mass/mass) amylene[4] various ethanol amylene blends
Dichloromethane	Hydrochloric acid, chlorine, phosgene (CCl_2O)	25 ppm (mass/mass) amylene 25 ppm (mass/mass) cyclohexene 400–600 ppm (mass/mass) methanol various amylene methanol blends
Alcohols		
Ethanol	Water, numerous denaturants are commonly added	
Methanol	Water; formal dehydrate (at elevated temperature)	
Ketones		
Acetone	Diacetone alcohol, and higher oligomers	

[1] The peroxide concentration that is usually considered hazardous is 250 ppm (mass/mass).
[2] Ethanol does not actually stabilize diethyl ether, nor is it a peroxide scavenger, although it was thought to be so in the past. It is still available in chromatographic solvents to preserve the utility of retention relationships and analytical methods.
[3] 2,6-Di-*tert*-butyl-*p*-cresol.
[4] Amylene is a generic name for 2-methyl-2-butene.

DETECTORS FOR LIQUID CHROMATOGRAPHY

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides some comparative data for interpretation of results from the more common detectors applied to high-performance liquid chromatography (Refs. 1-6). In general, the operational parameters provided are for optimized systems, and represent the maximum obtainable in terms of sensitivity and linearity. In this table, the molar extinction coefficient is represented by ε.

Detector	Sensitivity	Linearity	Selectivity	Comments
Ultraviolet spectrophotometer	1×10^{-9} g (for compounds of ε = 10 000 to 20 000)	1×10^4	For UV-active functionalities, on the basis of absorptivity.	Relatively insensitive to flow and temperature fluctuations; non-destructive, useful with gradient elution; use mercury lamp for 254 nm, and quartz-iodine lamp for 350 nm to 700 nm; often a diode-array instrument is used to obtain entire UV-vis spectrum.
Refractive index detector (RID)	1×10^{-7} g	1×10^4	Universal, dependent on refractive-index difference with mobile phase	Relatively insensitive to flow fluctuations, but sensitive to temperature fluctuations; non-destructive, cannot be used with gradient elution; solvents must be degassed to avoid bubble formations; laser-based RI detectors offer higher sensitivity.
Fluorometric detector	1×10^{-11} g	1×10^5	For fluorescent species with conjugated bonding and/or aromaticity	Relatively insensitive to temperature and flow fluctuations; non-destructive; can be used with gradient elution; often, chemical derivatization is done on analytes to form fluorescent species; uses deuterium lamp for 190 nm to 400 nm, or tungsten lamp for 350 nm to 600 nm.
Amperometric detector	1×10^{-9} g	1×10^4	Responds to –OH functionalities	Used for aliphatic and aromatic —OH compounds, amines, and indoles; pulsed potential units are most sensitive, can be used with gradient elution and organic mobile phases; senses compounds in oxidatitive or reductive modes; mobile phases must be highly pure and purged of O_2;
Conductivity detector	1×10^{-9} g	2×10^4	Specific to ionizable compounds	Uses post-column derivatization to produce ionic species; especially useful for certain halogen, sulfur, and nitrogen compounds
Mass spectrometers	Interface dependent	Interface dependent	Universal, within limits imposed by interface	Complex, expensive devices highly dependent on an efficient interface; electrospray and thermospray interfaces are most common; linear response is difficult to achieve.

SOLVENTS FOR ULTRAVIOLET SPECTROPHOTOMETRY

This table lists some solvents commonly used for sample preparation for ultraviolet spectrophotometry. The properties given are:

- λ_c: cutoff wavelength, below which the solvent absorption becomes excessive.
- ε: dielectric constant (relative permittivity); the temperature in °C is given as a superscript.
- t_b: normal boiling point.

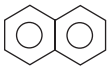
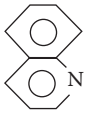
CORRELATION TABLE FOR ULTRAVIOLET ACTIVE FUNCTIONALITIES





Thomas J. Bruno and Paris D. N. Svoronos

The following table presents a correlation between common chromophoric functional groups and the expected absorptions from ultraviolet (UV) spectrophotometry. While not as informative as infrared correlations, UV can often provide valuable qualitative information. In these tables, λ_{max} is the wavelength in nm at which the maximum absorption occurs, and ε_{max} is the extinction coefficient.

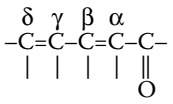
Isoquinoline		218	80 000	266	4000	317	3500

Note: ϕ denotes a phenyl group.

Wavenumber Adjustments for Bathochromic Shifts (Woodward's Rules)

Conjugated systems show bathochromic shifts in their π→π* transition bands. Empirical methods for predicting those shifts were originally formulated by Woodward (References 5–7) and Fieser and Fieser (Reference 8). This section includes the most important conjugated system rules. The reader should consult References 6 and 8 for more details on how to apply the wavelength increment data.



(a) Rules for Diene Absorption

Base value for diene: 214 nm

Increments for each (in nm):

Heteroannular diene	+ 0
Homoannular diene	+39
Extra double bond	+30
Alkyl substituent or ring residue	+5
Exocyclic double bond	+5
Polar groups:	
–OOCR	+0
–OR	+6
–S–R	+30
halogen	+5
$-NR_2$	+60
λ Calculated	= Total

(b) Rules for Enone Absorption*

Base value for acyclic (or six-membered) α,β-unsaturated ketone: 215 nm

Base value for five-membered α,β-unsaturated ketone: 202 nm

Base value for α,β-unsaturated aldehydes: 210 nm

Base value for α,β-unsaturated esters or carboxylic acids: 195 nm

Increments for each (in nm):

Heteroannular diene	+0
Homoannular diene	+39
Double bond	+30
Alkyl group:	
α–	+10
β–	+12
γ– and higher	+18
Polar groups:	
–OH	
α–	+35
β–	+30
δ–	+50
–OOCR	
α, β, γ, δ	+6
–OR	
α–	+35
β–	+30
γ–	+17
δ–	+31
–SR	
β–	+85
–Cl	
α–	+15
β–	+12
–Br	
α–	+25
β–	+30
$-NR_2$	
β–	+95
Exocyclic double bond	+5
λ Calculated	= Total

*Solvent corrections should be included. These are: water (-8), chloroform (+1), dioxane (+5), ether (+7), hexane (+11), and cyclohexane (+11). No correction is included for methanol or ethanol.

(c) Rules for monosubstituted benzene derivatives
Parent Chromophore (benzene): 250 nm

Substituent	Increment (in nm)
–R	–4
–COR	–4
–CHO	0
–OH	–16
–OR	–16
–COOR	–16

where R is an alkyl group, and the substitution is on C_6H_5–.

(d) Rules for disubstituted benzene derivatives
Parent Chromophore (benzene): 250 nm

	Increment (in nm)		
Substituent	***o*–**	***m*–**	***p*–**
–R	+3	+3	+10
–COR	+3	+3	+10
–OH	+7	+7	+25
–OR	+7	+7	+25
$–O^-$	+11	+20	+78 (variable)
–Cl	+0	+0	+10
–Br	+2	+2	+15
$–NH_2$	+13	+13	+58
$–NHCOCH_3$	+20	+20	+45
$–NHCH_3$	—	—	+73
$–N(CH_3)_2$	+20	+20	+85

R indicates an alkyl group.

WAVELENGTH-WAVENUMBER CONVERSION TABLE

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides a conversion between wavelength and wavenumber units for use in infrared spectrophotometry (Refs. 1 and 2). Because spectra are presented in different formats, this table is an aid in interpretation.

MIDDLE-RANGE INFRARED ABSORPTION CORRELATION CHARTS

Thomas J. Bruno and Paris D. N. Svoronos

The following charts provide characteristic middle-range infrared absorptions obtained from particular functional groups on molecules (Refs. 1 and 2). These include a general mid-range correlation chart, a chart for aromatic absorptions, and a chart for carbonyl moieties. Charts for near infrared absorptions and for inorganic moieties can be found in the cited references.

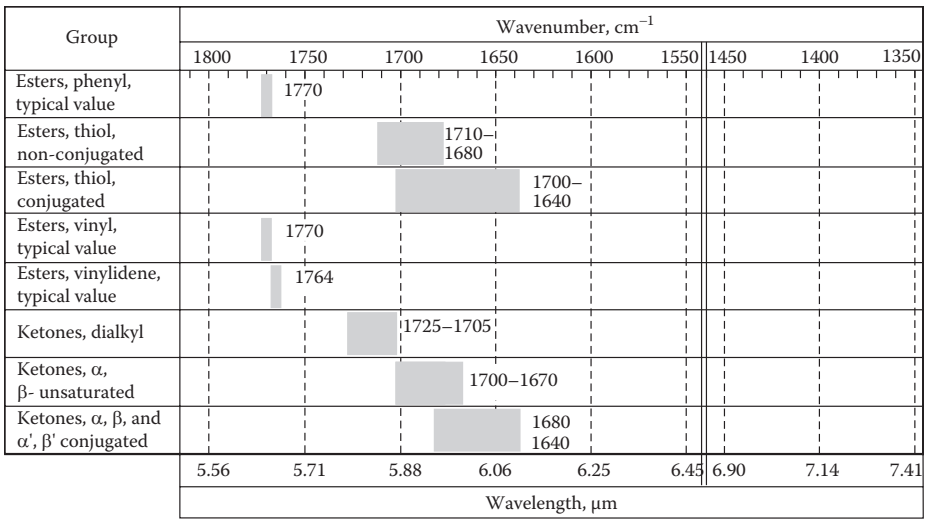
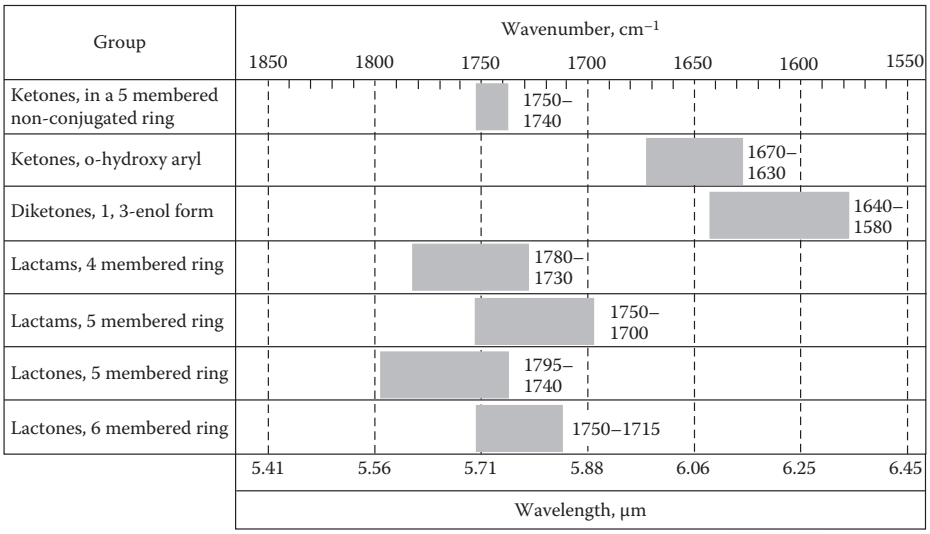
* Electron withdrawing groups at the α-position to the carbonyl will raise the wavenumber of the absorption.

Carbonyl Group Absorptions (continued)



** This band is the more intense of the two.
*** Intensity weakens as colinearity is approached.

Carbonyl Group Absorptions (continued)



* Electron withdrawing groups in the α-position to the carbonyl will raise the wavenumber adsorption.

COMMON SPURIOUS INFRARED ABSORPTION BANDS

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides some of the common potential sources of spurious infrared absorptions that might appear on a spectrum (Refs. 1 and 2]. Occasionally, the spectral lines of some impurities can be used as diagnostics; the reader is referred to the references for more details.

Approximate Wavenumber/cm^{-1}	Wavelength/μm	Compound or Group	Origin
3700	2.70	H_2O	Water in solvent (thick layers)
3650	2.74	H_2O	Water in some quartz windows
3450	2.9	H_2O	Hydrogen-bonded water, usually in KBr disks
2900	3.44	$-CH_3$, $>CH_2$	Paraffin oil, residual from previous mulls
2350 2330	4.26 4.30	CO_2 CO_2	Atmospheric absorption, or dissolved gas from a dry ice bath
2300 and 2150	4.35 and 4.65	CS_2	Leaky cells, previous analysis of samples dissolved in carbon disulfide
1996	5.01	BO_2^-	Metaborate in the halide window
1400–2000	5–7	H_2O	Atmospheric absorption
1820	5.52	$COCl_2$	Phosgene, decomposition product in purified $CHCl_3$
1755	5.7	Phthalic anhydride	Decomposition product of phthalate esters or resins; paint off-gas product
1700–1760	5.7–5.9	>C=O	Bottle-cap liners leached by sample
1720	5.8	Phthalates	Phthalate polymer plastic tubing
1640	6.1	H_2O	Water of crystallization entrenched in sample
1520	6.6	CO_2	Leaky cells, previous analysis
1430	7.0	CO_3^{-2}	Contaminant in halide window
1360	7.38	NO_3^-	Contaminant in halide window
1270	7.9	>SiO–	Silicone oil or grease
1000–1110	9–10	–>Si–O–Si<–	Glass; silicones
980	10.2	SO_4^{-2}	From decomposition of sulfates in KBr pellets
935	10.7	$(CH_2O)_x$	Deposit from gaseous formaldehyde
907	11.02	–>C–Cl	Dissolved R-12 (Freon-12, CCl_2F_2)
837	11.95	NO_3^-	Contaminant in halide window
823	12.15	KNO_3	From decomposition of nitrates in KBr pellets
794	12.6	CCl_4 vapor	Leaky cells, from CCl_4 used as a solvent
788	12.7	CCl_4 liquid	Incomplete drying of cell or contamination, from CCl_4 used as a solvent
720 and 730	13.7 and 13.9	Polyethylene	Various experimental sources
728	13.75	–>Si–F	SiF_4, found in NaCl windows
667	14.98	CO_3^{-2}	Atmospheric carbon dioxide
Any	Any	Fringes	If refractive index of windows is too high, or if the cell is partially empty, or the solid sample is not fully pulverized

NUCLEAR SPINS, MOMENTS, AND OTHER DATA RELATED TO NMR SPECTROSCOPY

David R. Lide

This table presents the following data relevant to nuclear magnetic resonance spectroscopy:

Z: Atomic number

Isotope: Element symbol and mass number

Abundance: Natural abundance of the isotope in percent. An * indicates a radioactive nuclide; if no value is given, the nuclide is not present in nature or its abundance is highly variable.

I: Nuclear spin

ν: Resonant frequency in megahertz for an applied field H_0 of 1 tesla (in cgs units, 10 kilogauss). The resonant frequency scales with H_0.

Relative sensitivity: Sensitivity relative to ^{1}H (=1) assuming an equal number of nuclei and constant temperature. Values were calculated from the expressions:

For constant H_0: $0.0076508(\mu/\mu_N)^3(I + 1)/I^2$
For constant ν: $0.23871(\mu/\mu_N)(I + 1)$

$\boldsymbol{\mu/\mu_N}$: Nuclear magnetic moment in units of the nuclear magneton μ_N

Q: Nuclear quadrupole moment in units of femtometers squared (1 fm^2 = 10^{-2} barn). Because the determination of quadrupole moments requires knowledge of the electron configuration near the nucleus, values of *Q* in the literature tend to scatter considerably. The values quoted here come mainly from the review of Pyykkö (Ref. 3), otherwise from Ref. 1.

The table includes all stable nuclides of non-zero spin for which spin and magnetic moment values have been measured, as well as selected radioactive nuclides of current or potential interest. At least one isotope is included for each element through $Z = 95$ for which data are available. See Reference 1 for a complete listing of spins and moments.

The assistance of P. Pyykkö in providing data on nuclear quadrupole moments is gratefully acknowledged.

PROPERTIES OF IMPORTANT NMR NUCLEI

Thomas J. Bruno and Paris D. N. Svoronos

The following table lists the magnetic properties at higher field strengths required for choosing the nuclei to be used in NMR experiments (Refs. 1–15). The reader is referred to several excellent texts and the literature for guidelines in nucleus selection. For more detailed information on these and other less common nuclei at 10 kG, the reader should consult the table entitled *Nuclear Spins, Moments, and Other Data Related to NMR Spectroscopy* in this section.

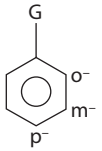
PROTON NMR ABSORPTION OF MAJOR CHEMICAL FAMILIES

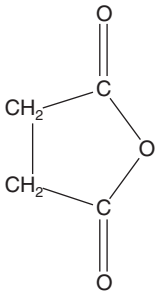
Thomas J. Bruno and Paris D. N. Svoronos

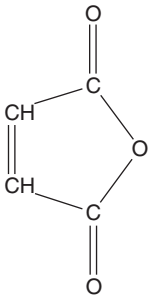
The following table gives the region of the expected nuclear magnetic resonance absorptions of major chemical families (Refs. 1–12). These absorptions are reported in the dimensionless units of parts per million (ppm) versus the standard compound tetramethylsilane (TMS, structure provided), which is recorded as 0.0 ppm.

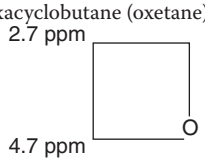


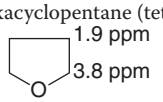
The use of this unit of measure makes the chemical shifts independent of the applied magnetic field strength or the radio frequency. For most proton NMR spectra, the protons in TMS are more shielded than almost all other protons. The chemical shift in this dimensionless unit system is then defined by:

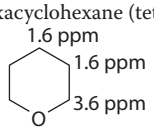
$$\delta = \frac{\nu_s - \nu_r}{\nu_r} \times 10^6$$

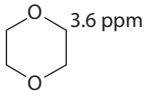


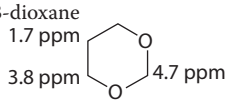


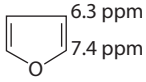












where ν_s and ν_r are the absorption frequencies of the sample proton and the reference (TMS) protons (twelve, magnetically equivalent), respectively. In these tables, the proton(s) whose proton NMR shifts are cited are indicated by underscore. Reference 1 provides additional details on the absorptions of other moieties, as well as correlation charts.

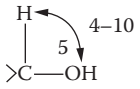
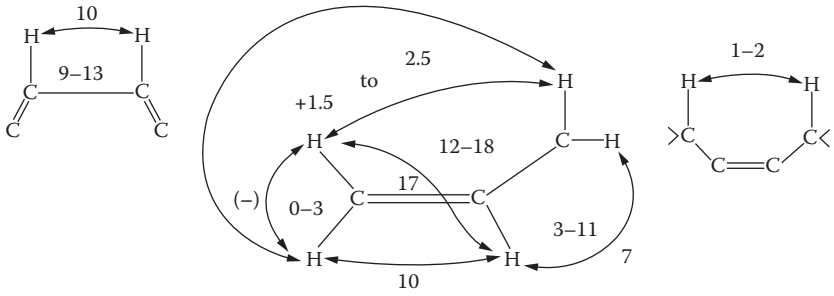
Note: Ar represents aryl.

Some Useful ^1H Coupling Constants

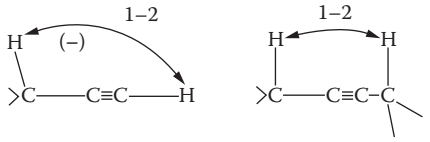


The following chart gives the values of some useful proton NMR coupling constants (in Hz). The single numbers indicate a typical or average value, while in some cases, the range is provided.

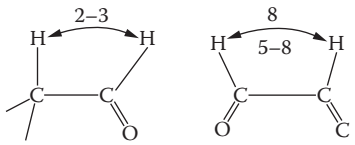
1. Freely rotating chains.



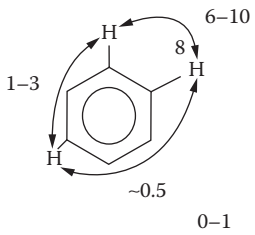
2. Alcohols with no exchange as in DMSO.
   - 1° = triplet
   - 2° = doublet (broad)
   - 3° = singlet



Upon addition of TFA, a sharp singlet results.



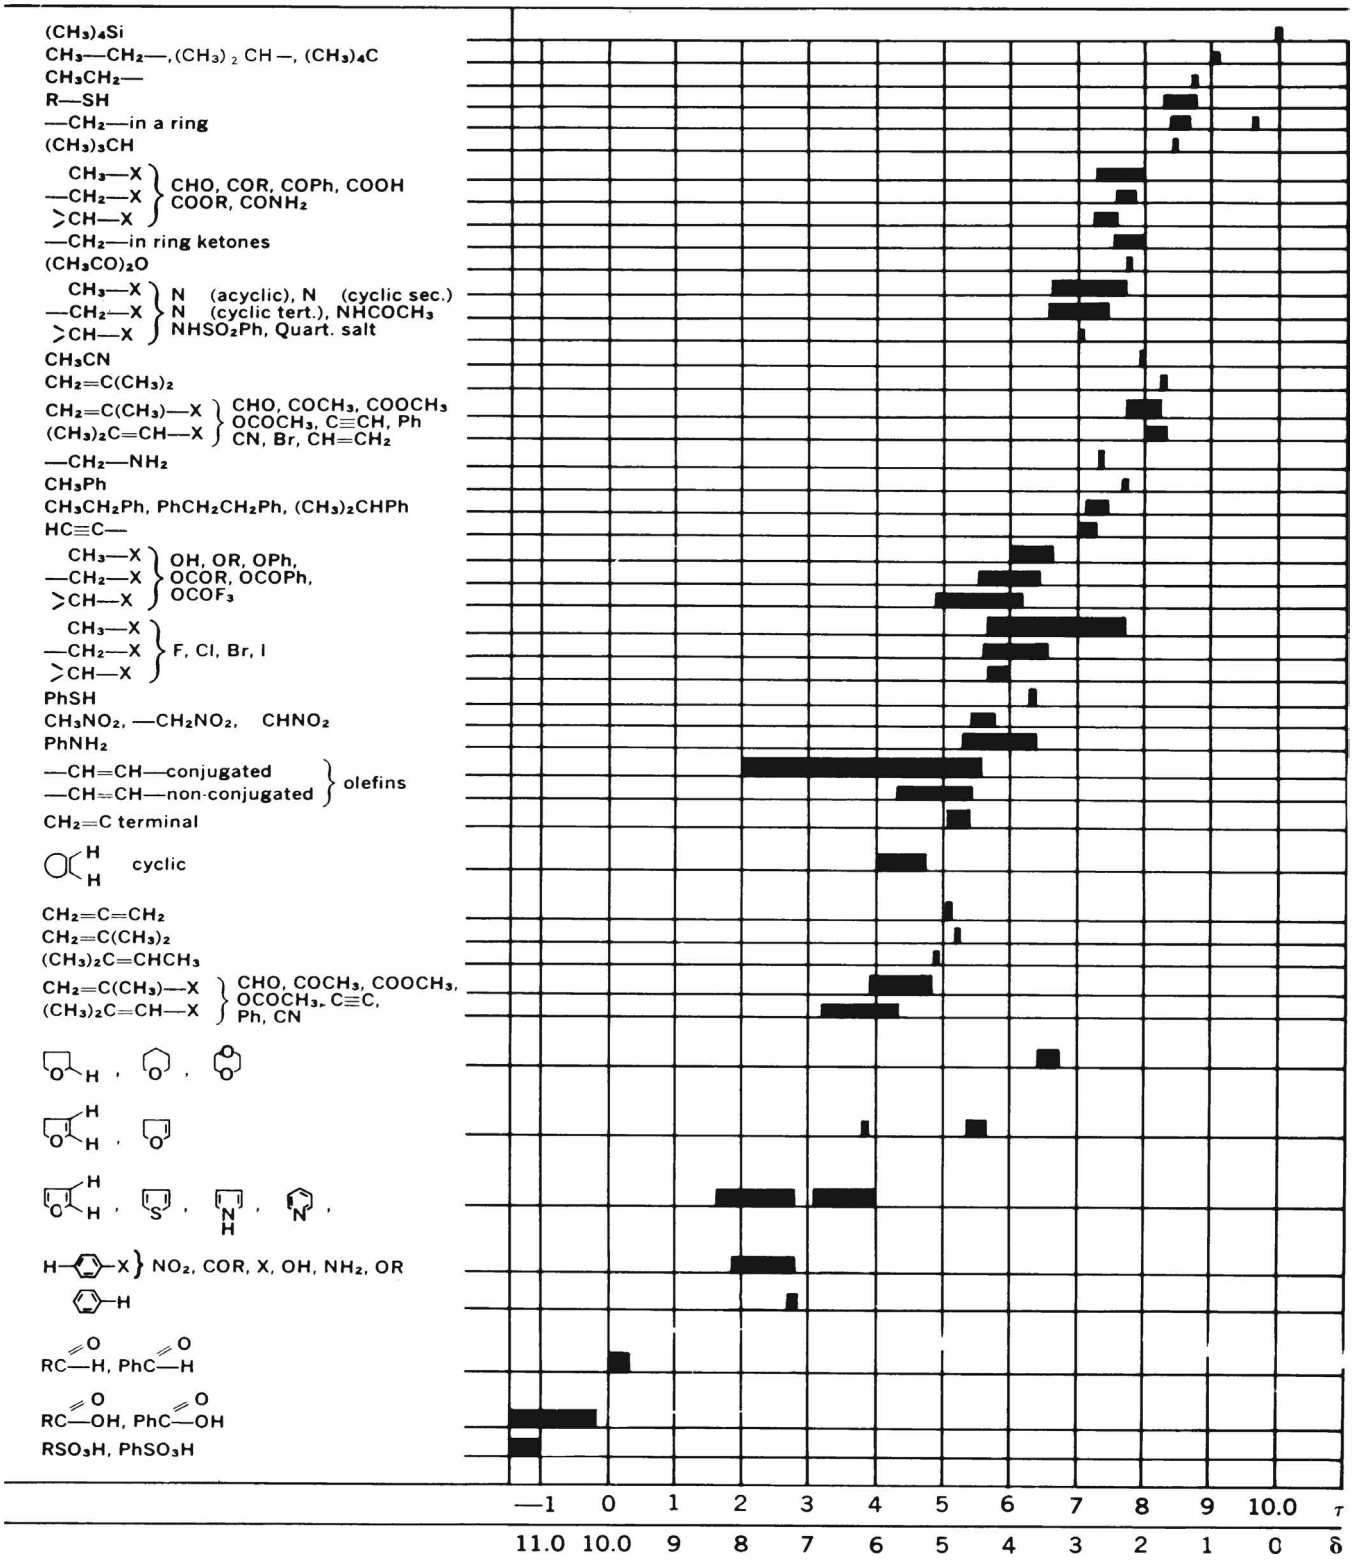
3. Alkenes



4. Alkynes

5. Aldehydes

6. Aromatic



PROTON NMR CORRELATION CHART FOR MAJOR ORGANIC FUNCTIONAL GROUPS

The chart below summarizes the range of chemical shifts for protons in several classes or organic compounds and substituent groups. The chemical shifts δ are given in parts per million relative to tetramethylsilane.

Reference

Mohacsi, E., *J. Chem. Edu.* 41, 38, 1964 (with permission).

PROTON NMR SHIFTS OF COMMON ORGANIC LIQUIDS

The table below lists the ^1H chemical shifts for over 300 organic liquids. The solvent in which the shift was measured is given in the third column. Shifts are given in parts per million relative to tetramethylsilane (TMS) and are listed in order of smallest to largest shift. In many cases the peaks show additional small splittings. Compounds are listed by name.

^{13}C-NMR ABSORPTIONS OF MAJOR FUNCTIONAL GROUPS

Thomas J. Bruno and Paris D. N. Svoronos

The table below lists the ^{13}C chemical shift ranges (in ppm) with the corresponding functional groups in descending order. Some typical simple compounds for every family are given to illustrate the corresponding range. The shifts for the carbons of interest are given in parentheses, either for each carbon as it appears from left to right in the formula, or by the underscore (Refs. 1–17). In Ref. 1, the reader can find additional details, correlation charts, additivity rules and the expected ^{13}C peaks attributed to common solvents.

			$\underline{C}H_3\underline{C}H_2\underline{C}H_2CH_2CH_3$	(13.9, 22.8, 34.7)
			Cyclohexane	(26.9)

^{13}C-NMR CHEMICAL SHIFTS OF COMMON ORGANIC SOLVENTS

The following table gives the expected carbon-13 chemical shifts, relative to tetramethylsilane, for various useful NMR solvents. In some solvents, slight changes can occur with change of concentration.[2,3]

1,1,2,2-Tetrachloroethane-d_2	$CDC1_2CDC1_2$	75.5
Tetrahydrofuran-d_8	C_4D_8O	25.8 (C_2) 67.9 (C_1)
Trichlorofluoromethane	$CFC1_3$	117.6

^{15}N-NMR CHEMICAL SHIFTS OF MAJOR CHEMICAL FAMILIES

Thomas J. Bruno and Paris D. N. Svoronos

The following table contains ^{15}N NMR chemical shifts of various organic nitrogen compounds. Chemical shifts are expressed relative to different standards (NH_3, NH_4Cl, CH_3NO_2, NH_4NO_3, HNO_3, etc.) and are interconvertible. Chemical shifts are sensitive to hydrogen bonding and are solvent dependent as seen in the case of pyridine (see footnote a below). Consequently, the reference as well as the solvent should always accompany chemical shift data. All shifts are relative to ammonia unless otherwise specified (Refs. 1–16). A section of "miscellaneous" data gives the chemical shift of special compounds relative to unusual standards. In Ref. 16, the reader can find additional details, correlation charts, and spin-spin coupling ranges.

Chemical Shift Range/ppm	Family	Example (δ)
<930	Nitroso compounds	C_6H_5–NO (913, 930)
608	Sodium nitrite	$NaNO_2$
~500	Azo compounds	C_6H_5–N=N–C_6H_5 (510)
380–350	Nitro compounds	$C_6H_5NO_2$ (370.3); CH_3NO_2 (380.2); 4-F–C_6H_4–NO_2 (368.5); 1,3-$(NO_2)_2C_6H_4$ (365.4)
367	Nitric acid (8.57 M)	HNO_3
360–325	Nitramines	CH_3NHNO_2 (355.6); $CH_3O_2CNHNO_2$ (334.9)
350–300	Pyridines	C_5H_5N (317)[a] (gas); 4-CH_3–C_5H_4N (309.3);4-NH_2–C_5H_4N (271.5); 4-NC–C_5H_4N (327.9)
~310	Imines (aromatic)	$(C_6H_5)_2C$=NH (308); C_6H_5CH=NCH_3 (318); C_6H_5CH=NC_6H_5 (326)
310.1	Nitrogen (gas)	N_2
250–200	Pyridinium salts	$C_5H_5NH^+$ (215)
260–175	Cyanides (nitriles)	CH_3CN (239.5, 245); C_6H_5CN (258.7); KCN 177.8
~160	Pyrroles, isonitriles	C_4H_4NH (158)CH_3NC (162)
~150	Thioamides	CH_3C(=S)NH_2 (150.2)
120–110	Lactams	$HN(CH_2)_3C$=O (5-membered ring; 114.7) $HN(CH_2)_6C$=O (8-membered ring; 117.7)
110–100	Amides	$C_6H_5CONH_2$ (100); CH_3CONH_2 (103.4); $CH_3CONHCH_3$ (105.8); $CH_3CON(CH_3)_2$ (103.8); $HCONH_2$ (108.5)
125–90	Sulfonamides	$CH_3SO_2NH_2$ (95); $C_6H_5SO_2NH_2$ (94.3)
~100	Hydrazines	$C_6H_5NHNHC_6H_5$ (96)
110–60	Ureas	$[H_2N]_2CO$ (75, 82); $[(CH_3)_2N]_2CO$ (63.5); $[C_6H_5NH]_2CO$ (107.7)
100–70	Aminophospines, aminophosphine oxides	$C_6H_5NHP(CH_3)_2$ (71.1) $C_6H_5NHPO(CH_3)_2$ (86.6)
70–50	Aromatic amines	$C_6H_5NH_2$ (55, 59), (–322.3)[b]; $C_6H_5NH_3^+$ (48), (–326.4)[b], 26.1[c]; p–O_2N–C_6H_4–NH_2 (70)
40–0	Aliphatic amines	CH_3NH_2 (1.3)[d], (–371)[b]; $(CH_3)_2NH$ (–363.3)[b], (–364.9)[e], 6.7[d]; $(CH_3)_3N$ (–356.9)[b], (–360.7)[e], 13.0[d]
50–10	Isonitriles	CH_3NCO (14.1); C_6H_5NCO (46.5)
65–20	Ammonium salts	NH_4Cl (26.1)[d]; CH_3NH_3Cl (24.5); $(CH_3)_2NH_2Cl$ (26.6); $(CH_3)_3NHCl$ (33.8); $(CH_3)_4NCl$ (44.7)
~15	Isocyanates	CH_3NCO (14.1)
Miscellaneous:		
(–130)–(–110) and ~(–212)	Imidazoles	*N*-methylimdazole (–111.4, pyridine N and -215.7, pyrrole N)[b]
(–345)–(–310)[b]	Piperidine, hydrochloride salts	piperidinium hydorchloride (–344.8); 2-methyl piperdinium hydrochloride (–322.1)[e]
	Decahydroquinolines, hydrochloride salts	*trans*-decahydroquinolinium hydrochloride (-322.5); *cis*-decahydroquinolinium hydrochloride (–328.5)

Chemical Shift Range/ppm	Family	Example (δ)
(−293)–(−280)[f]	Enaminones	$CH_3C(=O)CH=CHNHCH_3$ [(*E*)-(−294.2); (*Z*)-(−285.9)]
35–15[g]	4-Aminotetrahydropyrans, 4-aminotetrahydro-thiopyrans	2,6-diphenyl 4-aminotetrahydropyran (34.5) 2,6-diphenyl 4-aminotetrahydrothiopyran (33.6)
(−325)–(−310)[c]	1-Naphthylamines	8-nitro-1-naphthylamine (313.9)
(−350)–(−300)[h]	Silylamines	$HN[Si(CH_3)_3]_2$ (−354.2)

[a] Varies with solvent. For instance: cyclohexane (315.5), benzene (312.1), chloroform (304.5), methanol (292.1), water (289), 2,2,2-trifluoroethanol (277.1). All chemical shifts relative to ammonia.
[b] Upfield from external HNO_3 1M (CH_3OH).
[c] In ppm upfield from external 1M $D^{15}NO_3$ in D_2O (DMSO) (Ref. 10).
[d] Downfield from anhydrous liquid ammonia, ±0.2 ppm unless otherwise specified.
[e] Upfield from external HNO_3 1M (cyclohexane).
[f] Relative to external $CH_3{}^{15}NO_2$.
[g] With respect to an external standard of 5M $^{15}NH_4NO_3$ in 2M HNO_3 ($^{15}NH_4NO_3$ = 21.6 ppm relative to anhydrous ammonia) (Ref. 9).
[h] Relative to $N(SiH_3)$ (50 % in $CDCl_3$) (Ref. 11).

NATURAL ABUNDANCE OF IMPORTANT ISOTOPES

Thomas J. Bruno and Paris D. N. Svoronos

The following table lists the atomic masses and relative percent concentrations of naturally occurring isotopes of importance in mass spectroscopy (Refs. 1–6).

Bromine	^{79}Br (78.9183, 50.5)		^{81}Br (80.91642, 49.5)
Iodine	^{127}I (126.90466, ≈100.0)		

COMMON MASS SPECTRAL FRAGMENTATION PATTERNS OF ORGANIC COMPOUND FAMILIES

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides a guide to the identification and interpretation of commonly observed mass spectral fragmentation patterns for common organic functional groups (Refs. 1–10). It is of course highly desirable to augment mass spectroscopic data with as much other structural information as possible. Especially useful in this regard will be the confirmatory information of infrared and ultraviolet spectrophotometry as well as nuclear magnetic resonance spectrometry.

The reader is referred to other tables in this book for additional information that can be used in assessing or predicting fragmentation patterns, particularly the tables of "Proton Affinities" and "Ionization Energies of Gas-Phase Molecules" in Sec.10.

Family	Molecular Ion Peak	Common Fragments; Characteristic Peaks
Acetals		Cleavage of all C–O, C–H, and C–C bonds around the original aldehydic carbon
Alcohols	Weak for 1° and 2°; not detectable for 3°; strong for benzyl alcohols	Loss of 18 (H_2O — usually by cyclic mechanism); loss of H_2O and olefin simultaneously with four (or more) carbon-chain alcohols; prominent peak at *m/z* = 31(CH_2ÖH)$^+$ for 1° alcohols; prominent peak at *m/z* = (RCHÖH)$^+$ for 2° alcohols; and *m/z* = (R_2CÖH)$^+$ for 3° alcohols
Aldehydes	Low intensity	Loss of aldehydic hydrogen (strong M-1 peak, especially with aromatic aldehydes); strong peak at *m/z* = 29(HC≡O$^+$); loss of chain attached to alpha carbon (beta cleavage); McLafferty rearrangement via beta cleavage if gamma hydrogen is present
Alkanes		
(a) Chain	Low intensity	Loss of 14 mass units (CH_2)
(b) Branched	Low intensity	Cleavage at the point of branch; low intensity ions from random rearrangements
(c) Alicyclic	Intense	Loss of 28 mass units (CH_2=CH_2) and side chains
Alkenes (olefins)	Rather high intensity (loss of π-electron) especially in case of cyclic olefins	Loss of units of general formula C_nH_{2n-1}; formation of fragments of the composition C_nH_{2n} (via McLafferty rearrangement); retro Diels-Alder fragmentation
Alkyl halides	Abundance of molecular ion F<Cl<Br<I; intensity decreases with increase in size and branching	Loss of fragments equal to the mass of the halogen until all halogens are cleaved off
(a) Fluorides	Very low intensity	Loss of 20 (HF); loss of 26 (C_2H_2) in case of fluorobenzenes
(b) Chlorides	Low intensity; characteristic isotope cluster	Loss of 35 (Cl) or 36 (HCl); loss of chain attached to the gamma carbon to the carbon carrying the Cl
(c) Bromides	Low intensity; characteristic isotope cluster	Loss of 79 (Br); loss of chain attached to the gamma carbon to the carbon carrying the Br
(d) Iodides	Higher than other halides	Loss of 127 (I)
Alkynes	Rather high intensity (loss of π-electron)	Fragmentation similar to that of alkenes
Amides	High intensity	Strong peak at *m/z* = 44 indicative of a 1° amide (O=C=NH$^+_2$); base peak at *m/z* = 59 (CH_2=C(OH)N^+H_2); possibility of McLafferty rearrangement; loss of 42 (C_2H_2O) for amides of the form $RNHCOCH_3$ when R is aromatic ring
Amines	Hardly detectable in case of acyclic aliphatic amines; high intensity for aromatic and cyclic amines	Beta cleavage yielding >C=N$^+$<; base peak for all 1° amines at *m/z* = 30 (CH_2=N^+H_2); moderate M-1 peak for aromatic amines; loss of 27 (HCN) in aromatic amines; fragmentation at alpha carbons in cyclic amines

Family	Molecular Ion Peak	Common Fragments; Characteristic Peaks
Aromatic hydrocarbons (arenes)fdsds	Intense	Loss of side chain; formation of RCH=CHR' (via McLafferty rearrangement); cleavage at the bonds beta to the aromatic ring; peaks at *m/z* = 77 (benzene ring; especially mono-substituted), 91 (tropyllium); the ring position of alkyl substitution has very little effect on the spectrum
Carboxylic acids	Weak for straight-chain monocarboxylic acids; large if aromatic acids	Base peak at *m/z* = 60 (CH_2=C(OH)$_2$) if alpha hydrogen is present; peak at *m/z* = 45 (COOH); loss of 17 (–OH) in case of aromatic acids or short-chain acids
Disulfides	Low intensity	Loss of olefins (*m/z* equal to R–S–S–H$^{+\cdot}$); strong peak at *m/z* = 66 ($HSSH^+$)
Phenols	Highly intense peak (base peak* generally)	Loss of 28 (C=O) and 29 (CHO); strong peak at *m/z* = 65 ($C_5H_5^+$)
Sulfides (thioethers)	Rather low intensity peak but higher than that of corresponding ether	Similar to those of ethers (–O– substituted by –S–); aromatic sulfides show strong peaks at *m/z* = 109 ($C_6H_5S^+$.); 65 ($C_5H_5^+$.); 91 (tropyllium ion)
Sulfonamides	Intense	Loss of *m/z* = 64 ($SONH_2$) and *m/z* = 27 (HCN) in case of benzenesulfonamide
Esters	Weak intensity	Base peak at *m/z* equal to the mass of R–C≡O$^+$; peaks at *m/z* equal to the mass of $^+$O≡C–OR', the mass of OR' and R'; McLafferty rearrangement possible in case of: (a) presence of a beta hydrogen in R' (peak at *m/z* equal to the mass of R–C($^+$OH)OH, and (b) presence of a gamma hydrogen in R (peak at *m/z* equal to the mass of (CH_2=C($^+$OH)OR); loss of 42 (CH_2=C=O) in case of benzyl esters; loss of ROH via the ortho effect in case of o–substituted benzoates
Ketones	High intensity	Loss of R–groups attached to the >C=O (alpha cleavage); peak at *m/z* = 43 for all methyl ketones (CH_3CO^+); McLafferty rearrangement via beta cleavage if gamma hydrogen is present; loss of *m/z* = 28 (C=O) for cyclic ketones after initial alpha cleavage and McLafferty rearrangement
Mercaptan (thiols)	Rather low intensity but higher than that of corresponding alcohol	Similar to those of alcohols (–OH substituted by –SH); loss of *m/z* = 45 (CHS) and *m/z* = 44 (CS) for aromatic thiols
Nitriles	Unlikely to be detected except in case of acetonitrile (CH_3CN) and propionitrile (C_2H_5CN)	M+1 ion may appear (especially at higher pressures); M-1 peak is weak but detectable (R–CH=C=N$^+$); base peak at *m/z* = 41 (CH_2=C=N$^+$H); McLafferty rearrangement possible; loss of HCN is case of cyanobenzenes
Nitrites	Absent (or very weak at best)	Base peak at *m/z* = 30 (NO^+); large peak at *m/z* = 60 (CH_2=O$^+$NO) in all unbranched nitrites at the alpha carbon; absence of *m/z* = 46 permits differentiation from nitro compounds
Nitro compounds	Seldom observed	Loss of 30 (NO); subsequent loss of CO (in case of aromatic nitro- compounds); loss of NO_2, *m/z* = 46, from molecular ion peak
Sulfones	High intensity	Similar to sulfoxides; loss of mass equal to RSO_2; aromatic heterocycles show peaks at M-32 (sulfur), M-48 (SO), M-64 (SO_2)
Sulfoxides	High intensity	Loss of 17 (OH); loss of alkene (*m/z* equal to RSOH$^+$.); peak at *m/z* = 63 (CH_2=SH)$^+$; aromatic sulfoxides show peak at *m/z* = 125 ($^+$S–CH=CHCH=CHCHC=O), 97($C_5H_5S^+$), 93($C_6H_5O^\cdot$); aromatic heterocycles show peaks at M-16 (oxygen), M-29(COH); M-48(SO)

* The base peak is the most intense peak in the mass spectrum, and is often the molecular ion peak, M^+.

COMMON MASS SPECTRAL FRAGMENTS LOST

Thomas J. Bruno and Paris D. N. Svoronos

The following table gives a list of neutral species that are most commonly lost when measuring the mass spectra of organic compounds. The list is suggestive rather than comprehensive, and should be used in conjunction with other sources [1–5]. The listed fragments include only combinations of carbon, hydrogen, oxygen, nitrogen, sulfur, and the halogens.

MAJOR REFERENCE MASSES IN THE SPECTRUM OF HEPTACOSAFLUOROTRIBUTYLAMINE (PERFLUOROTRIBUTYLAMINE)

Thomas J. Bruno and Paris D. N. Svoronos

The following list tabulates the major reference masses (with their relative intensities and formulas) of the mass spectrum of heptacosafluorotributylamine (CAS No. 311-89-7) (Ref. 1). This is one of the most widely used reference compounds in mass spectrometry. For guidance in the selection of additional reference compounds, the reader is advised to consult Ref. 1.

Mass	Relative Intensity	Formula	Mass	Relative Intensity	Formula
613.9647	2.6	$C_{12}F_{24}N$	180.9888	1.9	C_4F_7
575.9679	1.7	$C_{12}F_{22}N$	175.9935	1.0	C_4F_6N

MASS SPECTRAL PEAKS OF COMMON ORGANIC LIQUIDS

David R. Lide

The strongest peaks in the mass spectra of 374 important organic liquids are listed in this table. The *m/z* value for each peak is followed by the relative intensity in parentheses, with the strongest peak assigned an intensity of 100. The peaks for each compound are listed in order of decreasing intensity. Compounds are listed by name.

Data on the physical properties of the same compounds may be found in Section 15 in the table *Laboratory Solvents and Other Liquid Reagents*.

COMMON SPURIOUS SIGNALS OBSERVED IN MASS SPECTROMETERS

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides guidance in the recognition and interpretation of potentially spurious signals (*m/z* peaks) that will sometimes be observed in measured mass spectra (Ref. 1). Often, the occurrence of these signals can be predicted by the recent history of the instrument or the method being used. This is especially true if the mass spectrometer is interfaced to a gas chromatograph.

Ions Observed, *m/z*	Possible Compound	Possible Source
13, 14, 15, 16	Methane*	Chlorine reagent gas
18	Water*	Residual impurity, outgassing of ferrules, septa and seals
14, 28	Nitrogen*	Residual impurity, outgassing of ferrules, septa and seals; leaking seal
16, 32	Oxygen*	Residual impurity, outgassing of ferrules, septa and seals; leaking seal
44	Carbon dioxide*	Residual impurity, outgassing of ferrules, septa and seals; leaking seal; note it may be mistaken for propane in a sample
31, 51, 69, 100, 119, 131, 169, 181, 214, 219, 264, 376, 414, 426, 464, 502, 576, 614	Perfluorotributyl amine (PFTBA), and related ions**	This is a common tuning compound; may indicate a leaking valve
31	Methanol	Solvent; can be used as a leak detector
43, 58	Acetone	Solvent; can be used as a leak detector
78	Benzene	Solvent; can be used as a leak detector
91, 92	Toluene	Solvent; can be used as a leak detector
105, 106	Xylenes	Solvent; can be used as a leak detector
151, 153	Trichloroethane	Solvent; can be used as a leak detector
69	Rough (fore) pump fluid, PFTBA	Back diffusion of fore pump fluid, possible leaking valve of tuning compound vial
73, 147, 207, 221, 281, 295, 355, 429	Dimethylpolysiloxane	Bleed from a column or septum, often during high temperature program methods in GC-MS
77, 94, 115, 141, 168, 170, 262, 354, 446	Diffusion pump fluid	Back diffusion from diffusion pump, if present
149	Phthalates	Plasticizer in vacuum seals, gloves
X – 14 peaks	Hydrocarbons	Loss of a methylene group indicates a hydrocarbon sample

* It is possible to operate the analyzer to ignore these common background impurities. They will be present to contribute to poor vacuum if these impurities result from a significant leak.

** See the table "Major Reference Masses in the Spectrum of Heptacosafluorotributylamine (Perfluorotributylamine) in this section for additional details.

CHLORINE–BROMINE COMBINATION ISOTOPE INTENSITIES

Thomas J. Bruno and Paris D. N. Svoronos

Due to the distinctive mass spectral patterns caused by the presence of chlorine and bromine in a molecule, interpretation of a mass spectrum can be much easier if the results of the relative isotopic concentrations are known. The following table provides peak intensities (relative to the molecular ion (M^+) at an intensity normalized to 100 percent) for various combinations of chlorine and bromine atoms, assuming the absence of all other elements except carbon and hydrogen (Refs. 1–4). The mass abundance calculations were based upon the most recent atomic mass data (Ref. 1).

REDUCTION OF WEIGHINGS IN AIR TO VACUO

When the mass M of a body is determined in air, a correction is necessary for the buoyancy of the air. The corrected mass is given by $M + kM/1000$, where k is a function of the material used for the weights, given by

$$k = 1000\rho_{air}(1/\rho_{body} - 1/\rho_{weight})$$

and ρ is density. The table below is computed for an air density of 0.0012 g/cm^3 and for densities of three common weights: platinum-iridium (21.6 g/cm^3), brass (8.5 g/cm^3), and aluminum or quartz (2.65 g/cm^3).

20.0	0.00	-0.08	-0.39
22.0	0.00	-0.09	-0.40

For a more accurate calculation, use the following values of the density of air (assuming 50% relative humidity and 0.04% CO_2).

	Air temperature		
P/kPa	10 °C	20 °C	30 °C
85	0.001043	0.001005	0.000968
90	0.001105	0.001065	0.001025
95	0.001166	0.001124	0.001083
100	0.001228	0.001184	0.001140
105	0.001290	0.001243	0.001198

Formulas for calculating the density of air over more extended ranges of temperature, pressure, and humidity may be found in the references.

STANDARDS FOR LABORATORY WEIGHTS

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides a summary of the requirements for metric weights and mass standards commonly used in chemical analysis (Refs. 1–3). The actual specifications are under the jurisdiction of ASTM Committee E-41 on General Laboratory Apparatus and are the direct responsibility of subcommittee E-41.06 that deals with weighing devices. These standards do not generally refer to instruments used in commerce. Weights are classified according to type (either Type I or Type II), grade (S, O, P, or Q), and class (1, 2, 3, 4, 5, or 6). Information on these mass standards is presented to allow the user to make appropriate choices when using analytical weights for the calibration of electronic analytical balances, for making large-scale mass measurements (such as those involving gas cylinders), and in the use of dead-weight pressure balances. Some historical context can be found in Ref. 4.

Type — Classification by Design

Type I — One-piece construction; contains no added adjusting material; used for highest accuracy work.

Type II — Can be of any appropriate and convenient design, incorporating plugs, knobs, rings, etc.; adjusting material can be added if it is contained so that it cannot become separated from the weight.

Grade — Classification by Physical Property

Grade S:	Density:	7.7 g cm^{-3} to 8.1 g cm^{-3} (for 50 mg and larger)
	Surface area:	not to exceed that of a cylinder of equal height and diameter
	Surface finish:	highly polished
	Surface protection:	none permitted
	Magnetic properties:	no more magnetic than 300 series stainless steels
	Corrosion resistance:	same as 303 stainless steel
	Hardness:	at least as hard as brass
Grade O:	Density:	7.7 g cm^{-3} to 9.1 g cm^{-3} (for 1 g and larger)
	Surface area:	same as grade S
	Surface finish:	same as grade S
	Surface protection:	may be plated with suitable material such as platinum or rhodium
	Magnetic properties:	same as grade S
	Corrosion resistance:	same as grade S
	Hardness:	at least as hard as brass when coated; smaller weights at least as hard as aluminum
Grade P:	Density:	7.2 g cm^{-3} to 10 g cm^{-3} (for 1 g or larger)
	Surface area:	no restriction
	Surface finish:	smooth, no irregularities
	Surface protection:	may be plated or lacquered
	Magnetic properties:	same as grades S and O
	Corrosion resistance:	surface must resist corrosion and oxidation
	Hardness:	same as grade O
Grade Q:	Density:	7.2 g cm^{-3} to 10 g cm^{-3} (for 1 g or larger)
	Surface area:	same as grade P
	Surface finish:	same as grade P
	Surface protection:	may be plated, lacquered, or painted
	Magnetic properties:	no more magnetic than unhardened unmagnetized steel
	Corrosion resistance:	same as grade P
	Hardness:	same as grades O and P

Tolerance — Classification by Deviation[1]

CLASS 1			CLASS 2		
Grams	Individual Tolerance/mg	Group Tolerance/mg	Grams	Individual Tolerance/mg	Group Tolerance/mg
500	1.2		500	2.5	
300	0.75		300	1.5	
200	0.50		200	1.0	
100	0.25	1.35	100	0.5	2.7
50	0.12		50	0.25	
30	0.074		30	0.15	
20	0.074		20	0.10	
10	0.050	0.16	10	0.074	0.29
5	0.034		5	0.054	
3	0.034		3	0.054	
2	0.034		2	0.054	
1	0.034	0.065	1	0.054	0.105

CLASS 3		CLASS 4		CLASS 5		CLASS 6	
Grams	Tolerance/mg	Grams	Tolerance/mg	Grams	Tolerance/mg	Grams	Tolerance/mg
500	5.0	500	10	500	30	500	50
300	3.0	300	6.0	300	20	300	30
200	2.0	200	4.0	200	15	200	20
100	1.0	100	2.0	100	9	100	10
50	0.6	50	1.2	50	5.6	50	7
30	0.45	30	0.9	30	4.0	30	5
20	0.35	20	0.7	20	3.0	20	3
10	0.25	10	0.5	10	2.0	10	2
				5	1.3	5	2
				3	0.95	3	2
				2	0.75	2	2
				1	0.50	1	2

[1] In simple terms, the permitted deviation between the assigned nominal mass value of the weight and the actual mass of the weight. Verification of tolerance should be possible on reasonably precise equipment, without using a buoyancy correction, within the political jurisdiction or organizational bounds of a given weight specification.

Applications for Weights and Mass Standards[1]

Application	Type	Grade	Class
Reference standards used for calibrating other weights	I	S	1,2,3, or 4[1]
High-precision standards for calibration of weights and precision balances	I or II[2]	S or O[2]	1 or 2[3]
Working standards for calibration and precision analytical work, dead-weight pressure balances	I or II[2]	S or O	2
Laboratory weights for routine analytical work	II	O	2 or 3
Built-in weights, high-quality analytical balances	I or II	S	2
Moderate precision laboratory balances	II	P	3 or 4
Dial scales and trip balances	II	Q	4 or 5
Platform scales	II	Q	5 or 6

[1] Primary standards are for reference use only and should be calibrated. Since the actual values for each weight are stated, close tolerances are neither required nor desirable.
[2] Type I and Grade S will have a higher constancy but will probably be higher priced.
[3] Since working standards are used for the calibration of measuring instruments, the choice of tolerance depends upon the requirements of the instrument. The weights are usually used at the assumed nominal values and appropriate tolerances should be chosen.

INDICATORS FOR ACIDS AND BASES

Thomas J. Bruno and Paris D. N. Svoronos

The following table lists the most common indicators together with their pH range and colors in acidic and basic media. Since the color change is not instantaneous at the pK_a value, a pH range is given where a combination of colors is present. This pH range, which varies between indicators, generally falls between the pK_a with a spread or uncertainty of 1 pH unit. All solutions are either aqueous or ethanol/aqueous (% ethanol, vol/vol) (Refs. 1–4). Reference 4 provides additional solution properties that are related to buffer and solvent properties, and Ref. 5 lists the exact quantities needed for the indicator solutions.

Name	Synonym	pH Range	Solvent	Color change (acidic to basic)
Crystal Violet	Gentian Violet	0.0-2.0	Aqueous	yellow to blue-violet
Pentamethoxy Red	2,4,2',4',2"-Pentamethoxytriphenylcarbinol	1.2-2.3	70% ethanol	red-violet to colorless
Thymol Blue		1.2-2.8	Aqueous	red to yellow
4'-Anilinoazobenzene-4-sulfonic acid, sodium salt	Tropaeolin OO	1.3-3.2	Aqueous	red to yellow
2,4-Dinitrophenol		2.4-4.0	50% ethanol	colorless to yellow
4-(Dimethylamino)azobenzene	Methyl Yellow	2.9-4.0	90% ethanol	red to yellow
Methyl Orange	Sodium *p*-dimethylaminoazobenzenesulfonate	3.1-4.4	Aqueous	red to orange
Bromophenol Blue	Bromphenol Blue	3.0-4.6	Aqueous	yellow to blue-violet
Tetrabromophenol Blue		3.0-4.6	Aqueous	yellow to blue
Congo Red		3.0-5.0	Aqueous	blue-violet to red
4-(Phenylazo)-1-naphthalenamine	α-Naphthyl Red	3.7-5.0	70% ethanol	red to yellow
Alizarin Red S	Sodium alizarinesulfonate	3.7-5.2	Aqueous	yellow to violet
Etoxazene	*p*-Ethoxychrysoidine	3.5-5.5	Aqueous	red to yellow
Bromocresol Green	3,3',5,5'-Tetrabromo-*m*-cresolsulfonephthalein	4.0-5.6	Aqueous	yellow to blue
Methyl Red	Benzoic acid, 2-[[4-(dimethylamino)phenyl]azo]-	4.4-6.2	Aqueous	red to yellow
Bromocresol Purple	Bromcresol Purple	5.2-6.8	Aqueous	yellow to purple
4-Nitrophenol		5.0-7.0	Aqueous	colorless to yellow
Chlorophenol Red		5.4-6.8	Aqueous	yellow to red
Azolitmin		5.0-8.0	Aqueous	red to blue
Bromothymol Blue	Bromthymol Blue	6.0-7.6	70% ethanol	yellow to blue
Bromophenol Blue	Bromphenol Blue	6.2-7.6	Aqueous	yellow to blue
Phenol Red	Phenolsulfonphthalein	6.4-8.0	Aqueous	yellow to red
Neutral Red		6.8-8.0	70% ethanol	red to yellow
Aurin	Rosolic acid	6.8-8.0	90% ethanol	yellow to red
Cresol Red	*o*-Cresolsulfonphthalein	7.2-8.8	Aqueous	yellow to red
p-Naphtholbenzein	α-Naphtholbenzein	7.3-8.7	70% ethanol	rose to green
Orange I	Tropaeolin 000	7.6-8.9	Aqueous	yellow to rose-red
Thymol Blue		8.0-9.6	Aqueous	yellow to blue
Phenolphthalein	3,3-Bis(4-hydroxyphenyl)-1(3*H*)-isobenzofuranone	8.0-10.0	70% ethanol	colorless to red
p-Naphtholbenzein	α-Naphtholbenzein	9.0-11.0	70% ethanol	yellow to blue
Thymolphthalein		9.4-10.6	90% ethanol	colorless to blue
Nile Blue	C.I. Basic Blue 12	10.1-11.1	Aqueous	blue to red
Alizarin Yellow R		10.0-12.0	Aqueous	yellow to lilac
4-Hydroxy-3'-nitroazobenzene-3-carboxylic acid, sodium salt	Salicylic Yellow	10.0-12.0	90% ethanol	yellow to orange-brown
4-[(4-Nitrophenyl)azo]-1,3-benzenediol	Diazo Violet	10.1-12.0	Aqueous	yellow to violet
4-[(2,4-Dihydroxyphenyl)azo] benzenesulfonic acid, sodium salt	Tropaeolin O	11.0-13.0	Aqueous	yellow to orange-brown
N-Methyl-*N*,2,4,6-tetranitroaniline	Nitramine	11.0-13.0	70% ethanol	colorless to orange-brown
Poirrier Blue C4B	C.I. Acid Blue 22	11.0-13.0	Aqueous	blue to violet-pink
2,4,6-Trinitrobenzoic acid		12.0-13.4	Aqueous	colorless to orange-red

PREPARATION OF SPECIAL ANALYTICAL REAGENTS

Paris D. N. Svoronos and Thomas J. Bruno

This listing of analytical reagents has been updated to include formulations based on more recent research, and to also include safety notes (Refs. 1–3). In the absence of specific cautions, the user must observe sound laboratory practice and housekeeping to avoid exposure and environmental contamination. When less familiar reagents are described, we include a chemical formula and a CAS registry number to avoid ambiguity. When a reagent calls for 95% ethanol, the azeotrope with water is specified unless noted. Additional details can be found in the references listed below.

Aluminon (qualitative test for aluminum). Aluminon is the name for the triammonium salt of aurintricarboxylic acid (5-[(3-carboxy-4-hydroxyphenyl)(3-carboxy-4-oxo-2,5-cyclohexadienylidene)methyl]-2-hydroxybenzoic acid triammonium salt, $C_{22}H_{23}N_3O_9$, CAS No. 569-58-4). Dissolve 1 g of the salt in 1 L of distilled water. Shake the solution well to ensure thorough mixing.

Bang's reagent (for glucose estimation). Dissolve (in the exact order) 100 g of potassium carbonate, 66 g of potassium chloride and 160 g of anhydrous potassium bicarbonate in approximately 700 mL of distilled water at 30 °C. Add (while stirring) 4.4 g of copper (II) sulfate and dilute to 1 L with distilled water after all CO_2 has been released. This solution should be shaken and saved in an air-tight flask. After 24 hours, 300 mL of it are diluted to 1 L with a saturated aqueous potassium chloride solution, shaken gently and used after 24 hours. 50 mL of this solution is equivalent to 10 mg glucose.

Barfoed's reagent (test for glucose). See Cupric acetate.

Baudisch's reagent. See Cupferron.

Benedict's solution (qualitative reagent for glucose). Dissolve 173 g of sodium citrate and 100 g of sodium carbonate in 800 mL of distilled water. Filter, if necessary, and dilute to 850 mL with distilled water. Dissolve 17.3 g of copper (II) sulfate pentahydrate in 100 mL of distilled water. Pour the latter solution, with constant stirring, into the carbonate-citrate solution and dilute to 1 L with distilled water.

Benzidine hydrochloride solution (for sulfate determination). Prepare a paste of 8 g of benzidine hydrochloride ($C_{12}H_8(NH_3)_2{\cdot}2HCl$) and 20 mL of distilled water, add 20 mL of 20% (mass/mass) HCl and dilute to 1 L with distilled water. Each mL of this solution is equivalent to 0.00357 g of H_2SO_4. Note that the reagent is often called benzidine dihydrochloride.

Bertrand's reagent (glucose estimation). Consists of the following solutions:

1. Dissolve 200 g of Rochelle salt (potassium sodium tartrate, $NaKC_4H_4O_6$) and 150 g of NaOH in sufficient distilled water to make 1.0 L of solution.
2. Dissolve 40 g of copper (II) sulfate pentahydrate in sufficient distilled water to a total of 1.0 L of solution.
3. Dissolve 50 g of iron (III) sulfate and 200 g of H_2SO_4 (sp. gr. 1.84) in sufficient distilled water to a total of 1.0 L of solution.
4. Dissolve 5 g of potassium permanganate in sufficient distilled water to a total of 1.0 L solution.

Bial's reagent (for pentose). Dissolve 1 g of orcinol (5-methyl-1,3-benzenediol, $C_7H_8O_2$, CAS No. 504-15-4) in 500 mL of 30% (mass/mass) HCl to which 30 drops of a 10% aqueous solution of iron (III) chloride have been added.

Boutron — Boudet soap solution: Consists of the following solutions:

1. Dissolve 100 g of pure castile soap (olive oil based) in about 2.5 L of 56% (vol/vol) aqueous ethanol.
2. Dissolve 0.59 g of barium nitrate in 1.0 L of water. Adjust the castile soap solution (1) so that 2.4 mL of it will produce a permanent lather with 40 mL of solution (2). When adjusted, 2.4 mL of this soap solution is equivalent to 220 parts per million of hardness (as calcium carbonate) for a 40 mL sample. See also Soap solution.

Brucke's reagent (protein precipitation). See Potassium iodide mercuric iodide.

Cobaltic cyanide paper (Rinnmann's test for zinc detection). Dissolve 4 g of potassium cobalt (III) hexacyanide ($K_3Co(CN)_6$) and 1 g of potassium chlorate in 100 mL of water. Soak filter paper in solution and dry at 100 °C. Apply a drop of the zinc solution and heat in an evaporating dish. A green disk on the filter paper is obtained if zinc is present.

Congo red. Dissolve 0.5 g of Congo red (3,3'-([1,1'-biphenyl]-4,4'-diyl)bis(4-amino naphthalene-1-sulfonic acid, $C_{32}H_{22}N_6Na_2O_6S_2$, CAS No. 573-58-0) in 90 mL of distilled water and 10 mL of ethanol.

Cupferron (Baudisch's reagent for iron analysis). Dissolve 6 g of Cupferron, the ammonium salt of *N*-hydroxy-*N*-nitrosoaniline ($NH_4[C_6H_5N(O)NO]$) in 100 mL of distilled water. The reagent is good only for one week and must be kept in the dark.

Cupric acetate (Barfoed's reagent for reducing monosaccharides). Dissolve 66 g of copper (II) acetate and 10 mL of glacial acetic acid in water and dilute to 1.0 L.

Cupric oxide, ammoniacal; Schweitzer's reagent (dissolves cotton, linen, and silk, but not wool). Dissolve 5 g of cupric sulfate in 100 mL of boiling water, and add sodium hydroxide until precipitation is complete. Wash the precipitate well, and dissolve it in a minimal quantity of ammonium hydroxide. Bubble a slow stream of air through 300 mL of concentrated ammonium hydroxide solution containing 50 g of fine copper turnings. Continue stirring for 1 hour.

Cupric sulfate in glycerin-potassium hydroxide (reagent for silk). Dissolve 10 g of copper (II) sulfate pentahydrate in 100 mL of water and add 5 g of glycerol. Add 6N KOH solution slowly until a deep blue solution is obtained.

Cupron (precipitates copper). Dissolve 5 g of benzoinoxime in 100 mL 95% ethanol.

Cuprous chloride, acidic (reagent for CO in gas analysis).

1. Cover the bottom of a 2 L flask with a layer of copper (II) oxide about 1.5 cm deep, suspend a coil of copper wire so as to reach from the bottom to the top of the solution, and fill the flask with hydrochloric acid 20% (vol/vol) HCl

(aq) with continuous stirring. When the solution becomes nearly colorless, transfer to reagent bottles, which should also contain copper wire. The stock bottle may be refilled with dilute (6N) HCl until either the cupric oxide or the copper wire is used up. Copper (II) sulfate may be substituted for copper oxide in the above procedure.

2. Dissolve 340 g of copper (II) chloride dihydrate in 600 mL of concentrated HCl and reduce the cupric chloride by adding 190 mL of a saturated solution of stannous chloride or until the solution is colorless. The stannous chloride is prepared by treating 300 g of metallic tin in a 500 mL flask with concentrated HCl until no more tin is dissolved.
3. (Winkler method). Add a mixture of 86 g of copper (II) chloride and 17 g of finely divided metallic copper, prepared by the reduction of 8 g to12 g of cupper (II) oxide with hydrogen gas, to a solution of HCl, made by diluting 650 mL of concentrated HCl with 325 mL of distilled water. After the mixture has been added slowly and with frequent stirring, a spiral of copper wire is suspended in the bottle, reaching all the way to the bottom. The solution is ready to use when the solution becomes colorless.

Cuprous chloride, ammoniacal (reagent for CO in gas analysis).

1. The acid solution of copper (II) chloride as prepared above is neutralized with 6N ammonium hydroxide until the ammonia odor persists. An excess of metallic copper must be kept in the solution.
2. Pour 800 mL of acidic copper (II) chloride, prepared by the Winkler method, into approximately 4 L of water. Transfer the precipitate to a 250 mL graduated cylinder. After several hours, siphon off the liquid above the 50 mL mark and refill with 7.5% ammonium hydroxide solution which may be prepared by diluting 50 mL of concentrated ammonium hydroxide with 150 mL of distilled water. The solution, which should have a faint odor of ammonia should be well stirred and allowed to stand for several hours.

Note: Proper precautions must be taken for the safe handling of gaseous samples that contain CO.

Dichlorofluorescein indicator. Dissolve 1 g dichlorofluorescein ($C_{20}H_{10}Cl_2O_5$, CAS No. 76-54-0) in 1 L 70% (vol/vol) ethanol or 1 g of the sodium salt in 1 L of distilled water.

Dimethyglyoxime, 0.01 N. Dissolve 0.6 g of dimethylglyoxime (2,3-butanedione oxime) in 500 mL of 95% ethanol. This is an especially sensitive test for nickel (II) and produces a very characteristic crimson color.

Diphenylamine (reagent for rayon). Dissolve 0.2 g diphenylamine in 100 mL of concentrated sulfuric acid.

Diphenylamine sulfonate (for titration of iron with $K_2Cr_2O_7$). Dissolve 0.32 g of the barium salt of diphenylamine sulfonic acid in 100 mL of distilled water, add 0.5 g of sodium sulfate and filter off the precipitated barium sulfate.

Diphenylcarbazide. Dissolve 0.2 g of diphenylcarbazide[$(C_6H_5NHNH)_2CO$] in 10 mL of glacial acetic acid and dilute to 100 mL with 95% ethanol.

2,4-Dinitrophenylhydrazine (2,4-DNP) Reagent. Dissolve 3 g of 2,4-dinitrophenylhydrazine in 15 mL to 20 mL of concentrated sulfuric acid. Add this solution with stirring to a solution of 10 mL distilled water in 70 mL of 95% hydrous ethanol. Use the filtrate to test for the presence of aldehydes and ketones as follows: To 2 mL of the solution add 10 drops of the unknown. A precipitate (which may be recrystallized from 95% hydrous ethanol) is indicative of a positive test and its melting point can be matched to the corresponding melting points of various aldehydes and ketones.

Esbach's reagent (estimation of protein). Dissolve 10 g of picric acid and 20 g of citric acid in sufficient distilled water to make a 1.0 L of solution.

Eschka's compound. Two parts of calcinated ("light") magnesia are thoroughly mixed with 1 part of anhydrous sodium carbonate.

Fehling's solution (reagent for reducing sugars).

1. Copper (II) sulfate solution: Dissolve 34.66 g of copper (II) sulfate pentahydrate in distilled water and dilute to 500 mL.
2. Alkaline tartrate solution: Dissolve 173 g of potassium sodium tartrate (Rochelle salt, $KNaC_4H_4O_6{\cdot}4H_2O$) and 50 g of NaOH in distilled water, cool and dilute to 500 mL. Mix equal volumes of solutions (1) and (2) just before using.

Ferric-alum indicator. Dissolve 140 g of iron (III) ammonium sulfate crystals in 400 mL of hot distilled water. Cool, filter, and add enough 6N nitric acid until the 500 mL mark.

Folin's mixture (for uric acid). To 650 mL of distilled water add 500 g of ammonium sulfate, 5 g of uranium (VI) acetate, and 6 g of glacial acetic acid and then dilute to 1.0 L with distilled water.

Formaldehyde — sulfuric acid (Marquis' reagent for alkaloids). Add 100 mL of concentrated sulfuric acid to 5 mL of 37% (mass/mass) aqueous formaldehyde solution.

Froehde's reagent. See Sulfomolybdic acid.

Fuchsin (reagent for linen). Dissolve 1 g of fuchsin (an aniline dye) in 100 mL of ethanol.

Fuchsin - sulfurous acid (Schiff's reagent for aldehydes). Dissolve 0.5 g of fuchsin and 9 g of sodium bisulfite in 500 mL of distilled water, and add 10 mL of concentrated HCl. Keep in well-stoppered bottles and protect from light. The fuchsin used to make the Schiff reagent should incorporate a high content of pararosanilin.

Gunzberg's reagent (detection of HCl in gastric juice). Dissolve 4 g of phloroglucinol (1,3,5-benzenetriol, $C_6H_3(OH)_3$) and 2 g of vanillin ($C_8H_8O_3$) in 100 mL of absolute ethanol.

Hager's reagent. See Picric acid.

Hanus solution (for iodine number). Dissolve 13.2 g of resublimed iodine in 1 L of glacial acetic acid, which should pass the dichromate test for reducible matter. Add sufficient bromine to double the halogen content, as determined by titration (approximately 3 mL). The iodine may be dissolved by heating, but the solution should be cold when the bromine is added.

Hopkins-Cole Reagent (test for presence of the indole ring in the tryptophan moiety of a protein or peptide). Add 5 mL cold water to 10 g of magnesium in a conical flask and add 250 mL of a cold saturated aqueous oxalic acid solution with vigorous stirring. Filter, add 25 mL of glacial acetic acid and dilute with distilled water to the 1.0 L mark. Place 10 drops of the saturated protein or peptide solution in a test tube, add 10 drops of concentrated nitric acid and heat in a water bath for three minutes. Allow the mixture to cool and add 4 mL 6N NaOH. A positive test is confirmed by the formation of a yellow color.

Iodine, tincture of. To 50 mL of distilled water add 70 g of iodine and 50 g of potassium iodide. Dilute to 1 L with absolute ethanol.

Iodo-potassium iodide (Wagner's reagent for alkaloids). Dissolve 2 g of iodine and 6 g of KI in 100 mL of distilled water.

Jones Reagent (test is positive for 1° and 2° alcohols, aldehydes, mercaptans, sulfides and sulfoxides). To 1 mL of 5% (mass/mass) sodium (or potassium) dichromate add 10 drops of the unknown compound. The formation of a green color (sometimes appearing as brown due to the mixture of the green chromium (III) and the unreacted orange chromium (VI) colors) indicates a positive test.

Litmus (indicator). Extract litmus powder three times with boiling alcohol (ethanol or isopropanol), each treatment lasting for an hour. Discard the alcoholic extract. Treat the residue with an equal mass of cold distilled water and filter; then add five times its weight of boiling distilled water. Cool, filter, and combine all aqueous extracts.

Magnesia mixture (reagent for phosphates and arsenates). Dissolve 50 g of magnesium chloride ($MgCl_2 \cdot 6H2O$) and 100 g of ammonium chloride (NH_4Cl) in 500 mL of distilled water, add a slight excess of NH_4OH, and allow to stand overnight. Filter, make the solution just acidic with HCl, and dilute with distilled water to 1 L. Let stand for several days and separate the precipitated solid by decanting. The decantate should be used just prior to testing; otherwise, if stored for any period of time it becomes turbid.

Magnesium uranyl acetate. Dissolve 100 g of uranyl (VI) acetate dehydrate ($UO_2(C_2H_3O_2)_2 \cdot 2H_2O$) in 60 mL of glacial acetic acid and dilute to 500 mL with distilled water. Dissolve 330 g magnesium acetate tetrahydrate ($Mg(C_2H_3O_2)_2 \cdot 4H_2O$) in 60 mL of glacial acetic acid and dilute to 200 mL. Heat both solutions to boiling until clear; pour the magnesium acetate solution into the uranyl acetate solution, cool and dilute with distilled water to 1 L. Let stand overnight and filter if necessary.

Marme's reagent. See Potassium-cadmium iodide.

Marquis' reagent. See Formaldehyde-sulfuric acid.

Mayer's reagent (white precipitate with most alkaloids in slightly acid solutions). Dissolve 1.358 g of mercury (II) chloride in 60 mL of distilled water and pour into a solution of 5 g of potassium iodide in 10 mL of distilled water. Add sufficient distilled water to a final volume of 100 mL.

Methyl orange indicator. Dissolve 1 g of methyl orange in 1 L of distilled water. Filter, if necessary.

Methyl orange, modified. Dissolve 2 g of methyl orange and 2.8 g of xylene cyanole FF ($C_{25}H_{27}N_2NaO_6S_2$, CAS No: 2650-17-1) in 1 L of 50% (vol/vol) ethanol.

Methyl red indicator. Dissolve 1 g of methyl red in 600 mL of ethanol and dilute with 400 mL of distilled water.

Methyl red, modified. Dissolve 0.50 g of methyl red and 1.25 g of xylene cyanole FF ($C_{25}H_{27}N_2NaO_6S_2$) in 1 L of 90% (vol/vol) ethanol. Alternatively dissolve 1.25 g of methyl red and 0.825 g of methylene blue in 1 L of 90% (vol/vol) ethanol.

Millon's reagent (for albumins and phenols). Dissolve 1 part of mercury in 1 part of cold fuming nitric acid. Dilute with twice the volume of distilled water and decant the clear solution after several hours. All appropriate precautions must be observed when handling mercury.

Molisch's reagent. See 1-Naphthol.

1-Naphthol (Molisch's reagent for wool). Dissolve 15 g of 1-naphthol in 100 mL of 95% (vol/vol) ethanol or chloroform.

Nessler's reagent (for ammonia). Dissolve 50 g of potassium iodide in the smallest possible quantity of cold distilled water (50 mL). Add a saturated solution of mercury (II) chloride (about 22 g in 350 mL of distilled water will be needed) until an excess is indicated by the formation of a precipitate. Then add 200 mL of 5 N NaOH and dilute to 1 L with distilled water. Allow to settle and draw off the clear liquid.

Nickel oxide, ammoniacal (reagent for silk). Dissolve 5 g of nickel (II) sulfate in 100 mL of distilled water, and add 6N NaOH solution until nickel hydroxide is completely precipitated. Wash the precipitate well and dissolve in 25 mL of concentrated ammonium hydroxide and 25 mL of distilled water.

Nitron (detection of the nitrate radical). Dissolve 10 g of nitron (1,4-diphenyl-3-(phenylamino)-1,2,4-triazolium hydroxide, $C_{20}H_{18}N_4O$) in 5 mL of glacial acetic acid and 95 mL of distilled water. The solution may be filtered with slight suction through an Alundum thimble crucible and kept in a dark bottle.

1-Nitroso-2-naphthol. Make a saturated solution 1-nitroso-2-naphthol in 50% (vol/vol) aqueous acetic acid. The reagent should be used as soon as it is prepared.

Nylander's solution (carbohydrates). Dissolve 20 g of bismuth subnitrate ($Bi_5O(OH)_9(NO_3)_4$) and 40 g of Rochelle salt (potassium sodium tartrate, $KNaC_4H_4O_6 \cdot 4H_2O$)in 1 L of 8% (mass/mass) aqueous NaOH solution. Cool and filter.

Obermayer's reagent (for indoxyl in urine). Dissolve 4 g of iron (III) chloride in 1 L of aqueous (vol/vol) 40% HCl.

Oxine. Dissolve 14 g of 8-hydroxyquinoline (C_9H_7NO) in 30 mL of glacial acetic acid. Warm slightly, if necessary to dissolve. Dilute to 1 L with distilled water.

Oxygen absorbent. Dissolve 300 g of ammonium chloride in 1 L distilled water and add 1 L of concentrated ammonium hydroxide solution. Shake the solution thoroughly. For use as an oxygen absorbent, the gas to be tested is passed through a bottle that is half full of copper turnings filled nearly to the top with this ammonium chloride - ammonium hydroxide solution.

Pasteur's salt solution. To 1 L of distilled water add 2.5 g of potassium phosphate, 0.25 g of calcium phosphate, 0.25 g of magnesium sulfate, and 12.00 g of ammonium tartrate.

Pavy's solution (glucose reagent). To 120 mL of Fehling's solution, add 300 mL of 6N ammonium hydroxide (sp. gr. 0.88) and dilute to 1 L with distilled water.

Phenanthroline ferrous ion indicator. Dissolve 1.485 g of 1,10-phenanthroline monohydrate ($C_{12}H_8N_2 \cdot H_2O$) in 100 mL of 0.025 M aqueous iron (II) sulfate solution.

Phenolphthalein. Dissolve 1 g of phenolphthalein in 50 mL of ethanol and add 50 mL of distilled water.

Phenolsulfonic acid (determination of nitrogen as nitrate). Dissolve 25 g of phenol in 150 mL of concentrated H_2SO_4, add 75 mL of fuming sulfuric acid (approximately 15% SO_3), stir well and heat for 2 hours at 100 °C.

Phloroglucinol solution (pentosans). Make a 3% phloroglucinol (1,3,5-benzenetriol) solution in alcohol. Store in a dark bottle.

Phosphomolybdic acid (Sonnenschein's reagent for alkaloids).

1. Prepare ammonium phosphomolybdate and after washing with distilled water, boil with nitric acid to expel all ammonia. Evaporate to dryness and dissolve in 2 M HNO_3.
2. Dissolve ammonium molybdate in HNO_3 and treat with phosphoric acid. Filter, wash the precipitate, and boil with aqua regia (a mixture of concentrated nitric acid and concentrated hydrochloric acid, 1:3 vol/vol) until the ammonium salt is decomposed. Evaporate to dryness. The residue is dissolved in 10% (vol/vol) HNO_3. The solution constitutes Sonnenschein's reagent.

Phosphoric acid — sulfuric acid mixture. Dilute 150 mL of concentrated sulfuric acid and 100 mL of concentrated phosphoric acid with distilled water to a final volume of 1 L.

Phosphotungstic acid (Scheibler's reagent for alkaloids).

1. Dissolve 20 g of sodium tungstate and 15 g of sodium phosphate in 100 mL of distilled water slightly acidified with dilute nitric acid.
2. The reagent is a 10% (mass/mass) solution of phosphotungstic acid in distilled water. The phosphotungstic acid is prepared by evaporating a mixture of 10 g of sodium tungstate dissolved in 5 g of phosphoric acid (sp. gr. 1.13) and enough boiling water to a complete solution. Crystals of phosphotungstic acid will separate.

Picric acid (Hager's reagent for alkaloids, wool and silk). Dissolve 1 g of picric acid in 100 mL of distilled water.

Potassium antimonate (reagent for sodium). Boil 22 g of potassium antimonate with 1 L of distilled water until nearly all of the salt has dissolved, cool quickly, and add 35 mL of 10% (mass/mass) potassium hydroxide. Filter after standing overnight.

Potassium-cadmium iodide (Marme's reagent for alkaloids). Add 2 g of cadmium (II) chloride to a boiling solution of 4 g of potassium iodide in 12 mL of distilled water, and then mix with 12 mL of saturated aqueous potassium iodide solution.

Potassium hydroxide (for CO_2 absorption). Dissolve 360 g of potassium hydroxide in distilled water and dilute to 1 L.

Potassium iodide — mercuric iodide (Brucke's reagent for proteins). Dissolve 50 g of potassium iodide in 500 mL of distilled water, and saturate with mercury (II) iodide (about 120 g). Dilute to 1 L with distilled water.

Potassium pyrogallate (for oxygen absorption). For mixtures of gases containing less than 28% (mass/mass) oxygen, add 100 mL of potassium hydroxide solution (50 g of KOH to 100 mL of distilled water) to 5 g of pyrogallol. For mixtures containing more than 28% (mass/mass) oxygen, the KOH solution should contain instead 120 g of KOH in 100 mL of distilled water.

Pyrogallol, alkaline. The reagent is a mixture of two solutions

1. Dissolve 75 g of pyrogallic acid in 75 mL of distilled water.
2. Dissolve 500 g of KOH in 250 mL distilled water. When cooled, adjust the solution with distilled water until the concentration is 50% (vol/vol).

For use, add 270 mL of solution (2) to 30 mL of solution (1).

Rosolic acid (indicator). Dissolve 1 g of rosolic acid ($C_{19}H_{14}O_3$) in 10 mL of ethanol and add 100 mL of distilled water.

Sakaguchi Reagent (for the presence of arginine in proteins or peptides). To 10 drops of the saturated protein or peptide solution, add 5 drops of 6 N NaOH followed by 5 drops of 0.05% (mass/mass) ethanolic 1-naphthol solution and 10 drops of 0.5% aqueous sodium hypochlorite. A positive test is indicated by the formation of a red color that fades away upon standing.

Scheibler's reagent. See Phosphotungstic acid.

Schiff's reagent. See Fuchsin-sulfurous acid.

Schweitzer's reagent. See Cupric oxide, ammoniacal.

Soap solution (reagent for hardness in water). Dissolve 100 g of dry castile soap in 1 L of 80% (vol/vol) ethanol (4 parts ethanol to 1 part distilled water). Allow to stand for several days and dilute with 70% ethanol until 6.4 mL of this solution produces a permanent lather with 20 mL of standardized calcium solution. The latter solution is made by dissolving 0.2 g of calcium carbonate in a small amount of dilute HCl, evaporating to dryness and then dissolving the precipitate with distilled water to a final volume of 1 L.

Sodium bismuthate (for the oxidation of manganese). Heat 20 parts of sodium hydroxide nearly to redness in an iron or nickel crucible and add slowly 10 parts of basic bismuth (III) nitrate which has been previously dried. Add 2 parts of sodium peroxide, and pour the brownish-yellow fused mass onto an iron plate to cool. When cooled, break up in a mortar, extract with distilled water, and collect on an asbestos filter.

Sodium hydroxide (for CO_2 absorption). Dissolve 330 g of sodium hydroxide in distilled water and dilute to 1 L.

Sodium nitroprusside (reagent for hydrogen sulfide and wool). Use a freshly prepared solution of 1 g of sodium nitroferricyanide in 10 mL of distilled water.

Sodium oxalate (primary standard). Dissolve 30 g of the commercial salt of sodium oxalate in 1 L of distilled water, make slightly alkaline with sodium hydroxide, and let stand until clear. Filter and evaporate the filtrate to 100 mL. Cool and filter. Pulverize the residue and wash it several times with small volumes of distilled water. The procedure is repeated until the mother liquor is sulfate-free and is neutral to phenolphthalein.

Sodium plumbite (reagent for wool). Dissolve 5 g of sodium hydroxide in 100 mL distilled water. Add 5 g of litharge (lead (II) oxide) and boil until dissolved.

Sodium polysulfide. Dissolve 480 g of sodium sulfide nonahydrate in 500 mL of distilled water, add 40 g of NaOH and 18 g of sulfur. Stir thoroughly and dilute to 1 L with distilled water.

Sonnenschein's reagent. See Phosphomolybdic acid.

Starch solution.

1. Make a paste with 2 g of soluble starch and 0.01 g of mercury (II) iodide with a small amount of distilled water. Add the mixture slowly to 1 L of boiling distilled water and boil further for a few minutes. Keep in a glass stoppered bottle. If other than soluble starch is used, the solution will not be clear on boiling; it should then be allowed to stand and the clear liquid decanted.
2. A solution of starch that keeps stable indefinitely is made as follows: Mix 500 mL of aqueous saturated NaCl solution (filtered), 80 mL of glacial acetic acid, 20 mL of distilled water and 3 g of starch. Bring slowly to a boil and further heat for 2 minutes.
3. Make a paste with 1 g of soluble starch and 5 mg of mercury (II) iodide using as little cold distilled water as possible. Then pour about 200 mL of boiling distilled water on the paste and stir immediately. This will give a clear solution if the paste is prepared correctly and the water is actually boiling. Cool and add 4 g of potassium iodide. Starch solution decomposes on standing due to bacterial action, but this solution will be stable if stored under a layer of toluene.

Stoke's reagent. Dissolve 30 g of iron (II) sulfate and 20 g of tartaric acid in distilled water and dilute to 1 L. Just before using, add concentrated ammonium hydroxide until the precipitate that is initially formed is redissolved.

Sulfanilic acid (reagent for nitrites). Dissolve 0.5 g of sulfanilic acid in a mixture of 15 mL of glacial acetic acid and 135 mL of recently boiled distilled water.

Sulfomolybdic acid (Froehde's reagent for alkaloids and glucosides). Dissolve 10 g of molybdic acid or sodium molybdate in 100 mL of concentrated sulfuric acid.

Tannic acid (reagent for albumin, alkaloids, and gelatin). Dissolve 10 g of tannic acid in 10 mL of ethanol and dilute with distilled water to 100 mL.

Titration mixture (residual chlorine in water analysis). Prepare 1 L of dilute HCl (100 mL of HCl (sp. gr. 1.19) in sufficient distilled water to make 1 L). Dissolve 1 g of *o*-tolidine (3,3'-dimethylbenzidine , CAS No. 119-93-7) in 100 mL dilute hydrochloride, stir well and dilute to 1 L using dilute HCl solution.

Tollen's Reagent (confirming the presence of aldehydes). 5 drops of 5% NaOH is added to 2 mL 10% aqueous silver nitrate in a test tube. The insoluble silver (I) oxide dissolved by the drop wise addition of 10% aqueous ammonia (ammonium hydroxide) yields a clear solution. Excess ammonium hydroxide should be avoided as it may give false positive result. Approximately 10 drops of the aldehyde will yield a silver mirror coating on the test tube inner wall, especially if the mixture is warmed up to 50 °C.

Trinitrophenol solution. See Picric acid.

Turmeric tincture (reagent for borates). Digest ground turmeric root with several quantities of distilled water which are discarded. Dry the residue and digest it several days with six times its weight of ethanol. Filter.

Uffelmann's reagent (turns yellow in presence of lactic acid). To a 2% solution of pure phenol in distilled water, add an aqueous solution of iron (III) chloride until the phenol solution becomes violet in color.

Wagner's reagent. See Iodo-potassium iodide.

Wagner's solution (used in phosphate rock analysis to prevent precipitation of iron and aluminum). Dissolve 25 g of citric acid and 1 g of salicylic acid in distilled water and dilute to 1 L. Use 50 mL of the reagent.

Wij's iodine monochloride solution (for iodine number). Dissolve 13 g of resublimed iodine in 1 L of glacial acetic acid that will pass the dichromate test for reducible matter. Set aside 25 mL of this solution. Bubble into the remainder of the solution dry chlorine gas (dried and washed by passing through concentrated sulfuric acid) until the characteristic color of free iodine has been dissipated. Add the 25 mL of the iodine solution that was set aside, until all free chlorine has been dissipated. A slight excess of iodine does little or no harm, but an excess of chlorine must be avoided. Preserve in well stoppered, amber colored bottles. Avoid the use of solutions that have been stored for more than 30 days.

Wij's special solution (for iodine number). To 200 mL of glacial acetic acid that will pass the dichromate test for reducible matter, add 12 g of dichloramine T (*N,N*-dichloro-4-methylbenzenesulfonamide, CAS No. 473-34-7), and 16.6 g of dry potassium crystals (in small quantities with continual shaking until all the potassium iodide has dissolved). Dilute to 1 L with the same quality of acetic acid used above and preserve in a dark colored bottle.

Zimmermann-Reinhardt reagent (determination of iron). Dissolve 70 g of manganese (II) sulfate tetrahydrate in 500 mL of water, add slowly 125 mL of concentrated sulfuric acid and 125 mL of 85% phosphoric acid, and dilute to 1 L with water.

Zinc chloride solution, basic (reagent for silk). Dissolve 1000 g of zinc chloride in 850 mL of distilled water, and add 40 g of zinc oxide. Heat until complete dissolving is complete.

Zinc uranyl acetate (reagent for sodium). Dissolve 10 g of $UO_2(C_2H_3O_2)2{\cdot}2H_2O$ in 6 g of 30% acetic acid, heat, if necessary, and dilute to 50 mL. Dissolve 30 g of zinc acetate dehydrate in 3 g of 30% acetic acid and dilute to 50 mL. Mix the two solutions, add 50 mg of sodium chloride, allow to stand overnight and filter. Use distilled water in all dilutions.

ORGANIC ANALYTICAL REAGENTS FOR THE DETERMINATION OF INORGANIC IONS

Paris D. N. Svoronos and Thomas J. Bruno

In this table of organic reagents used for determination of inorganic elements and compounds we present the major tests, reagents, and some guidance as to the expected result or method of observation. The abbreviations used here are defined in the abbreviations table in this section. In addition, for brevity, when a determination calls for a spectrophotometric measurement at a particular wavelength, for example at 500 nm, we denote this as: "spec λ = 500 nm." No wavelength is specified if it is variable, for example, with pH; here we indicate: "spec determination." When a determination calls for spectrofluorimetric determination, the excitation and emission wavelengths are provided, thus: specf λ_{ex} = 303.5 nm, λ_{em} = 353 nm. Note that a common surfactant used in many of these tests is cetyltrimethylammonium bromide, abbreviated (CTAB). Information and data on this and other surfactants commonly used in chemical analysis are provided in Section 6. When relevant, we provide an approximate limit of detection (LOD), and when the uncertainty can vary, this is expressed as a relative standard deviation (RSD). Some of the procedures listed here require the use of hazardous chemicals (carcinogens such as benzene, strong acids such as HF). Appropriate precautions must be observed.

While a great deal of the information presented here is from the recent literature, the reader is referred to several excellent reviews and monographs for additional information (Refs. 1–10).

I. Cations

Reagents	Results
Aluminum	
Alizarin red S	Red color develops; spectrophotometric determination preferred
Aluminon	Lake pigment stabilized with CTAB
Chrome azurol S	Spec λ; = 500 nm, stabilized with CTAB
Chromazol KS	Spec λ = 625 nm, stabilized with cetylpyridinium bromide
Eriochrome cyanine R (also known as mordant blue 3) + CTAB	Red dye lake (pH = 6) stabilized with CTAB
Eriochrome cyanine R (also known as mordant blue 3) + *N,N*-dodecyltrimethylammonium bromide (DTAB)	Spec determination by use of cationic surfactants
8-Hydroxyquinoline	Produces tris(8-hydroxyquinolinato) aluminum (Alq3), found in organic light emitting diodes (OLEDs)
Bromopyrogallol red + cetyltrimethyl ammonium bromide	Spec λ = 627 nm
Bromopyrogallol red + nonylphenol tetradecaethylene glycol ether	Spec λ = 612 nm
Pyrocatechol violet	Spec λ = 578 nm after separation of aluminum from the matrix materials by chloroform extraction of its acetylacetone complex (pH = 6.5), from an ammonium acetate-hydrogen peroxide medium
2,2′,3,4-Tetrahydroxy-3′,5′-disulfoazobenzene	Spec determination of the binary system (pH = 5)
Antimony	
Brilliant green	Isolated as the hexachloroantimonate (V) salt extracted by either toluene or benzene
Bromopyrogallol red	Used for the determination of antimony (III) with EDTA, cyanide or fluoride ions as masking agents
Catechol violet	Ternary complex stabilized with CTAB
Malachite green (basic green 4)	Isolated as the hexachloantimonate (V) complex after benzene extraction
Phenyl fluorene	Sensitive color reaction with antimony (III) by use of cationic surfactants
Potassium iodide	Antimony (III)-iodide complex formation in the presence of ascorbic acid
Rhodamine B	Ion pair or ion association extraction by use of toluene or benzene as solvents

Reagents	Results
Silver diethyldithiocarbamate	Spec λ = 504 nm to avoid arsenic interference
Thiourea	Determination by hydride generation inductively coupled plasma atomic emission spectrometry after reduction of antimony (V) to antimony (III) by thiourea
Arsenic	
Michler's ketone	Spec λ = 640 nm trophotometric determination of trace arsenic (V) in water
Silver diethyldithiocarbamate	Spec λ = 600 nm to avoid antimony interference
Thiourea	Determination by hydride generation inductively coupled plasma atomic emission spectrometry after reduction of arsenic (V) to arsenic (III) by thiourea
Barium	
Dimethylsulfonazo-III (DMSA-III)	Spec λ = 662 nm of the chelate complex
Alizarin S red	Red color used spectrophotometrically as a stain to determine the amount of barium in bone
Beryllium	
Aluminon	Lake pigment derivative
Ammonium bifluoride	Derivative detected by fluorescence
Beryllon II	A resin phase spectrophotometric method that detects a change in absorbance of the resin phase immobilized with beryllon II
Beryllon III	Determination achieved via third-derivative spectrophotometry and decolorization of excess reagent
Chrome azurol S	Spec determination with chrome azurol S in the presence of EDTA or CTAB
Eriochrome cyanine R + (CTAB)	Spec λ = 590 nm of ternary complex
Sulfon black F	Derivative has a long color-development time
Bismuth	
Amberlite XAD-7	Determination system implemented with (HG-ICP-AES) associated with flow injection (FI)
Sodium azide	Azidodimethylbismuthine precipitate formed by the reaction of the corresponding bismuthine with sodium azide
Diethyldithiocarbamate	Heterometric micro-determination of lead with sodium diethyldithiocarbamate by use of a mixture of EDTA, cyanide and ammonium hydroxide (λ = 400 nm)
Dithizone	Orange-red derivative that is extracted in carbon tetrachloride
Pyrocatechol violet	Spec determination of bismuth (III) with pyrocatechol violet in the presence of septonex CTAB
Quinolin-8-ol	Determination system implemented with HG-ICP-AES associated with flow injection (FI)
Thiourea	Determination by HG-ICP-AES
Xylenol orange	Derivative used for sol-gel thin films that serve as bismuth (III) sensors
Boron	
Azomethine H	Spec determination
Carminic acid	Spec determination
Curcumin	Spec determination of rosocyanine and rubrocurcumin formed by the reaction between borates and curcumin
Methylene blue	Spec determination of complex formed between fluoroborate ions and methylene blue after treatment with hydrofluoric and sulfuric acids and extraction with ethylene chloride
Cadmium	
2-(5-Bromo-2-pyridylazo)-5-diethylaminophenol (PAR)	Spec determination in the presence of cationic surfactant cetylpyridinium chloride
Cadion	Determination by β-correction spectrophotometry with cadion and surfactant Triton-X
Dithizone	Determination of dithizonate derivative by the extraction – spectrophotometric method
1-(2-Pyridylazo)-2-naphthol (PAN)	Two-dimensional absorption spec determination of complex in aqueous micellar solutions
4–(2-Pyridylazo)resorcinol	Preconcentration by cloud point extraction of the complex; determination by ICP optic emission spectrometry. Simultaneous spectrophotometric determination of cadmium and mercury
Calcium	
Alizarin S	Red dye used in staining bones for calcium determination
Chlorophosphonazo III	Spec λ = 667.5 nm (pH = 2.2)
Eriochrome black T + EDTA	Complexometric titration where the initially formed red calcium-eriochrome black T color is replaced with the blue calcium-EDTA color at the end point
Glyoxal-bis(2-hydroxyanil)	Spectrophotometric titration of the complex without preliminary extraction
Murexide	Spec λ = 506 nm (pH = 11.3)
Phthalein purple	High-performance chelation ion chromatography involving dye-coated resins
Cerium	
Butaperazine dimaleate propericiazine	Spec determination of the colored complex in a phosphoric acid medium
Persulfate oxidation to cerium (IV)	UV spec λ = 320 nm
Propericiazine	Spec determination of the colored complex in a phosphoric acid medium

Reagents	Results
Propionyl promazine phosphate (PPP)	Spec λ = 513 nm of the red-colored radical cation formed upon the reaction of PPP with cerium(IV) in a phosphoric acid medium
N-Benzoyl-*N*-phenylhydroxylamine	Spec titration of the cerium (IV) complex (pH = 8 to 10)
Sodium triphosphate	Specf λ_{ex} = 303.5 nm, λ_{em} = 353 nm of the cerium(III) complex
8-Hydroxyquinoline	Spec determination of the metal-ligand complex
Chromium	
Alizarin S	Lake pigment complex formation
1,5-Diphenylcarbazide	Spec determination during sonication in carbonated aqueous solutions saturated with CCl_4 that produces chlorine radicals
3-(2-Pyridyl)-5,6 bis(5-(2 furyl disulfonic acid))-1,2,4-triazine disodium salt (ferene-TM)	Indirect spec λ = 593 nm in aqueous samples with a chromogen ferene-TM
4-(2-Pyridylazo)resorcinol (PAR)	Spec determination of the ternary chromium-peroxo-PAR ternary complex
4-(2-Pyridylazo)resorcinol (PAR) + hydrogen peroxide	Spec determination of the ternary chromo-peroxo-PAR mixture after ethyl acetate extraction in 0.1 M sulfuric acid
4-(2-Pyridylazo)resorcinol (PAR) + xylometazolonium (XMH) chloride	Spec determination of the orange-red anionic complex formed in a heated acetate buffer medium (pH = 4.0 to 5.5) and extracted with the xylometazolonium (XMH) chloride
Sulfanilic acid	Spec λ = 360 nm on the catalytic effect of chromium (VI) in the oxidation of sulfanilic acid by hydrogen peroxide with *p*-aminobenzoic acid as an activator
Cobalt	
8-Hydroxyquinoline	Spec determination of the metal-ligand complex
p-Nitroso-*N,N*-dimethylaniline	Spec determination of the binary complex
Nitroso-R salt	AAS by use of a continuous on-line precipitation-dissolution procedure
1-Nitroso-2-naphthol	Spec determination by use of non-ionic surfactant Triton X-100
1-Nitroso-2-naphthol	Spec Tween 80 micellar determination
1-Nitroso-2-naphthol	AAS by use of a continuous on-line precipitation-dissolution procedure based on 1-nitroso-2-naphthol
2-Nitroso-1-naphthol	Spec λ = 530 nm after isoamyl acetate extraction
1-(2-Pyridylazo)-2-naphthol + surfactants	Spec λ = 620 nm of the cobalt complex in the presence of surfactants (Triton X-100 combined with sodium dodecylbenzene sulfonate (DBS)) and trace of ammonium persulfate (pH = 5.0)
4-(2-Pyridylazo)resorcinol (PAR)	Spec determination of complex at both pH = 7.2 to 7.9 and in 1 M H_2SO_4
4-(2-Pyridylazo)resorcinol (PAR) + triethanolamine	Ion-pair reversed-phase high-performance liquid chromatography of the complex
Copper	
Bathocuproine disulfonic acid	Spec λ = 470 nm to 550 nm of the bathocuproine-disulfonic acid complex after extraction with chloroform and methanol by use of (PLS_2)
Dithizone	Spec determination of the dithizone complex at pH = 2.3
Neocuproine	Spec determination of the deep orange-red Cu(neocuproine)$_2^+$ complex color
Cuprizone	Spec determination of the highly chromogenic copper (III) cuprizone complex
p-Nitroso-*N,N*-dimethylaniline	Spec determination of the binary complex
1-Nitroso-2-naphthol	Spec determination by use of non-ionic surfactant Triton X-100
4-(2-Pyridylazo)resorcinol	Preconcentration of copper by cloud point extraction of the complex and determination by ICP optic emission spectrometry
Europium	
1-Nitroso-2-naphthol	Spec Tween 80 micellar determination
ChromAsurol S	Spec determination of the binary complex
4-(2-Pyridylazo)resorcinol (PAR) + tetradecyldimethyl-benzylammonium chloride (TDBA)	Spec λ = 510 nm of the ion-associate complex extracted with chloroform at pH = 9.7
Gallium	
Chrome azurol S + (CTAB)	Spec λ = 640 nm of the ternary complex
Haematoxylin or its oxidized form + (CTAB)	Spec determination of the ternary complex of indium with haematoxylin or its oxidized form in the presence of cationic, anionic and non-ionic surfactants such as (CTAB)
Pyrocatechol violet + diphenylguanidine	Spec determination of the ternary complex
8-hydroxyquinoline	Spec determination of the gallium complex
1-(2-Pyridylazo)-2-naphthol	Spectrofluorimetric determination of Ga(III) with 1-(2-pyridylazo)-2-naphthol in sodium dodecyl sulfate micellar medium
4-(2-Pyridylazo)resorcinol (PAR)	Extraction and spec λ = 510 nm of gallium with 4-(2-pyridylazo) resorcinol
Rhodamine B	Comparison of the determination of gallium by a rhodamine B spectrophotometric method and by an AA method based on preliminary solvent extraction
Xylenol orange + 8-hydroxyquinoline	Spectrophotometric determination of the ternary complex
Germanium	
Brilliant Green + Molybdate	Spec λ = 430 nm of the yellow germanomolybdic acid

Reagents	Results
Phenylfluorone	Spec determination of the complex previously extracted with carbon tetrachloride at pH = 3.1
Gold	
5-(4-Diethylaminobenzylidene) rhodanine	Immobilized 5-(4-dimethylamino-benzylidene) rhodanine serves as a stable solid sorbent for trace amounts of gold (III) ions (pH = 2 to 4)
Di(methylheptyl)methyl phosphonate (DMHMP)	Trace gold determination by on-line preconcentration with flow injection atomic absorption spectrometry, by use of di(methylheptyl)methyl phosphonate (DMHMP) as the immobilized phase loaded onto a macroporous resin
2-Mercaptobenzothiazole	Radiochemical separation and determination of gold complex matrices employing substoichiometric thermal neutron activation analysis
Molybdate + nile blue (NB)	A spectrophotometric method based on the reaction of gold(III) with molybdate and nile blue (NB) to form an ion-association complex in the presence of poly(vinyl alcohol)
Rhodamine B	Aqueous spec determination of gold with rhodamine B and surfactant
Hafnium	
Arsenazo III	Spec determination of the arsenazo III complex in 10 M HCl or H_2SO_4
Indium	
Bromopyrogallol red	Spec determination of indium after an ether extraction from hydrobromic acid, and benzyl alcohol extraction of its complex with bromopyrogallol red (pH 9.0)
5-Bromine-salicylaldehyde salicyloylhydrazone (5-Br-SASH)	Specf λ_{ex} = 395 nm, λ_{em} = 461 nm of the indium: 5-Br-SASH chelate in a water–ethanol (63%) medium (pH = 4.6)
Chrome azurol S	Spec determination of the binary complex
Chrome azurol S + benzyldodecyl-dimethylammonium bromide (BDDMAB)	Spec determination of the mixed complex with chrome azurol S and (BDDMAB)
Chrome azurol S + (CTAB)	Spec λ = 630 nm of the ternary complex after *n*-butyl acetate extraction from hydrobromic acid
Chrome azurol S + cationic surfactants	Spec determination by use of chrome azurol S and surfactants such as CTA, CP, or zephiramine
Dithizone	Spec determination of the binary complex
Haematoxylin or its oxidized form + (CTAB)	Spec determination of the ternary complex of indium with haematoxylin or its oxidized form in the presence of cationic, anionic and non-ionic surfactants such as (CTAB)
8-Hydroxyquinoline	Spec determination of the binary complex
Methylthymol blue + zepheramine	Spec determination of the ternary complex
1-(2-Pyridylazo)-2-naphthol (PAN)	Spec determination of the chelate complex after chloroform extraction (pH = 6)
4-(2-Pyridylazo)resorcinol	Spec λ = 520 nm after indium extraction from the aqueous phase (pH 5.0 to 5.5) into chloroform with *N-p*-chlorophenyl-2-furohydroxamic acid and formation of the 4-(2-pyridylazo)resorcinol red chelate
Pyrocatechol violet	Spec determination of the binary complex
Pyrocatechol violet + tridodecylammonium bromide	Spec determination of the ternary complex
Quinalizarin (1,2,5,8-tetrahydroxyanthra-quinone)	Spec λ = 565 nm of the binary 3:1 Quinalizarin:In(III) colored complex in dimethylformamide-water solution
2,2′,3,4-Tetrahydroxy-3′,5′-disulfoazobenzene	Spec determination of the binary system (pH = 5)
Xylenol orange	Spec determination of the ternary complex
Iridium	
1,5-Diphenylcarbazide	Spec determination of the complex (pH = 5.0)
1-(2-Pyridylazo)-2-naphthol	Spec λ = 550 nm of the red complex (pH = 5.1) after chloroform extraction
Iron	
Bathophenanthroline	Determination of iron(II) in the presence of thousand-to-one ratio of iron(III) by use of bathophenanthroline
Bathophenantroline-disulfonic acid	Spec λ = 470 nm to 550 nm of the bathophenantroline-disulfonic acid complex after extraction with chloroform and methanol
2,2′-Bipyridine	Spec determination of the iron (II)-2,2′-bipyridine dark red complex
FerroZine	Spec λ = 562 nm of iron (II)-ferrozine complex after all iron(III) has been reduced by ascorbic acid
Hematoxylin + (CTAB)	Spec of the ternary complex. Addition of CTAB shifts λ_{max} from 630 nm to 640 nm
1-Nitroso-2-naphthol	Spec determination by use of non-ionic surfactant Triton X-100
1-Nitroso-2-naphthol	Spec determination Tween 80 micellar determination
1,10-Phenanthroline (o-Phen)	Spec λ = 508 nm of the $Fe(o\text{-}Phen)_3^{+2}$ complex
1,10-Phenanthroline + bromothymol blue	Spec determination of the $Fe(o\text{-}Phen)_3^{+2}$ complex in the presence of bromothymol blue
Phenylfluorone	Spec λ = 530 nm of the binary complex (pH = 9.0)
Phenylfluorone + Triton X	Spec λ = 555 nm of the binary complex sensitized with Triton X-100 (pH = 9.0)
Lanthanum	
Ammonium purpurate	Spec determination of lanthanum with ammonium purpurate as a chromogenic reagent

Reagents	Results
Arsenazo III	Spec determination of the lanthanum complexation with reagents of the arsenazo III group on the solid phase of fibrous ion exchangers
Eriochrome cyanine R (ECR)	Spec λ = 540 nm of the binary complex
N-Phenylbenzohydroxamic acid + xylenol orange	Solvent extraction followed by the spec λ = 600 nm of the ternary complex (pH = 8.8 to 9.5)
Lead	
Dithizone	Orange-red derivative that is extracted in carbon tetrachloride
Sodium diethyldithiocarbamate	Electrothermal AAS determination of the diethyldithiocarbamate derivative extracted in carbon tetrachloride
Sodium diethyldithiocarbamate	Heterometric micro-determination of lead diethyldithiocarbamate derivative
4-(2-Pyridylazo)resorcinol	Spec λ = 520 nm of 4-(2-pyridylazo)-resorcinol:lead (1:1) complex in an ammonia-ammonium chloride medium at pH = 10 after extracting the lead in isobutyl methyl ketone
Lithium	
1-(*o*-Arsenophenylazo)-2-naphthol-3, 6-disulfonate (Thoron)	Spec λ = 480 nm of Thoron-lithium complex in an alkaline acetone medium is measured against the reagent as reference
Magnesium	
Chlorophosphonazo III	Spec λ = 669 nm (pH = 7.0)
Eriochrome black T + EDTA	Complexometric titration where the initially formed red magnesium-eriochrome black T color is replaced with the blue magnesium-EDTA color at the end point
8-Hydroxyquinoline	Volumetric, titrimetric, and colorimetric determination
8-Hydroxyquinoline + butylamine	Spec λ = 380 nm of the complex after chloroform extraction
Titan yellow	Spec determination of magnesium by titan yellow in biological fluids
Xylidyl blue	Spec determination of magnesium in biological fluids
Manganese	
Formaldoxime	Spec determination of the formaldoxime/ammonia complex (pH = 8.8 to 8.9)
1-(2-Pyridylazo)-2-naphthol (PAN)	Preconcentration determination by use of (PAN) anchored SiO_2 nanoparticles
Mercury	
Dithizone	Spec λ = 500 nm of dithizone complex after chloroform extraction at pH = 0.3
Michler's thioketone	Spec λ = 560 nm of the binary complex in acetate buffer
4-(2-Pyridylazo)resorcinol	Simultaneous spec determination of cadmium and mercury with 4-(2-pyridylazo)resorcinol
Rhodamine 6G	Photoelectrochemical determination of mercury (II) in aqueous solutions by use of a rhodamine 6G derivative (RS) and polyaniline (PANI) coated optical probe in a photoelectrochemical cell
Xylenol orange + amine buffer	Spec λ = 590 nm of Hg(II)/xylenol orange complex display a sharp hyperchromic effect in the presence of amine buffers (pH= 7.5)
Xylenol orange + citric acid-phosphate buffer	Spec λ = 580 nm of Hg(II)/xylenol orange complex display a sharp hypochromic effect upon substituting amine buffers with a citric acid-phosphate (pH = 7.5)
Molybdenum	
Bromopyrogallol red + cetylpyridium chloride	Sequential injection analysis to the determination of CPC based on the sensitized molybdenum-bromopyrogallol red reaction
Phenylfluorone	Spec λ = 560 nm of molybdenum with phenylfluorone (pH of 1.5 to 3)
8-Hydroxyquinoline-5-sulfonic acid and phenylfluorone	Diffuse reflection spectrometry with 8-hydroxyquinoline-5-sulfonic acid and phenylfluorone after sorbing on a disk of an anion exchange fibrous material
Pyrocatechol violet	Preconcentration (by use of basic anion exchanger AV-17-10P) and determination via diffuse reflection spectroscopy. The colored surface compound to be determined involves Mo(VI) sorption on the resin and subsequent treatment of the concentrate obtained with pyrocatechol violet
Neodymium	
Semi-xylenol orange + cetylpyridinium chloride	Fourth-order derivative spectrophotometric determination of the ternary complex
Neptunium	
Arsenazo III	Spec λ after separation by use of thenoyltrifluoroacetone extraction method and determination in 5M HNO_3
Nickel	
2-(5-Bromo-2-pyridylazo)-5-diethylaminophenol	Spec λ = 520 nm and 560 nm of the red-violet complex in water-ethanol (pH = 5.5)
Dimethylglyoxime + ammonia	Spec λ = 543 nm of the complex
Dimethylglyoxime, voltammetry	Nickel voltammetric determination at a chemically modified electrode based on dimethylglyoxime-containing carbon paste
2,2′-Furildioxime	Spec λ = 438 nm after separation by adsorption of its α-furildioxime complex on naphthalene
Hematoxylin	Spec λ = 595 nm of the binary system (pH = 7.8 to 8.3)
Hematoxylin + (CTAB)	Spec λ = 608 nm of the ternary system (pH = 7.4 to 8.1)

Reagents	Results
1-Nitroso-2-naphthol	Spec Tween 80 micellar determination
p-Nitroso-*N,N*-dimethylaniline	Spec determination of the binary complex
2-(2-Pyridylazo)-2-naphthol	Derivative spectrophotometry λ= 569 nm determination of nickel complex in Tween 80 micellar solutions
4-(2-Pyridylazo)resorcinol	Preconcentration of nickel by cloud point extraction of the complex and determination by ICP optic emission spectrometry
1-(2-Thiazolylazo)-2-naphthol (TAN)	Flow-injection solid phase spectrophotometry by use of TAN immobilized on C_{18}-bonded silica (λ = 595 nm)
Xylenol orange	Spec determination by mean centering of ratio kinetic profile (pH = 5.3)
Niobium	
N-Benzoyl-*N*-phenylhydroxylamine	Separation and determination of the complex from a tartrate solution at pH > 2
Bromopyrogallol red	Spec λ = 610 nm of complex extracted into isopentyl acetate containing di-*n*-octylmethylamine
O-Hydroxyhydroquinonephthalein (Qnph) + hexadecyltrimethyl-ammonium chloride (HTAC)	Spec λ = 520 nm of the complex in strong acidic media
4-(2-Pyridylazo)resorcinol + citrate	Determination of the ternary complex by ion-interaction reversed-phase HPLC on a C_{18} column with a 5 mM citrate buffer (pH = 6.5, λ = 540 nm)
Pyrocatechol violet	Extraction and spec determination of niobium complex in the presence of pyridine and trichloroacetic acid
Sulfochlorophenol S	Spec determination of the complex after extraction into amyl alcohol
Xylenol orange	Spec λ = 530 nm of chelate (pH = 5.0)
Osmium	
1,5-Diphenylcarbazide	Spec λ = 560 nm of the bluish-violet complex after extraction with isobutyl methyl ketone
Thiourea	Spec λ = 540 nm of the red-rose complex in acid medium
Palladium	
Ammonia + iodide	Thermogravimetric determination of palladium as $Pd(NH_3)_2I_2$
2,2- *bis*-[3-(2-Thiazolylazo)-4-4-hydroxyphenyl-propane], (TAPHP)	Application of TAPHP immobilized on silica beads to determine the palladium concentration in a trans-luminance configuration (pH = 2) by use of flow-through spectrophotometric sensing phase
2-(5-Bromo-2-pyridylazo)-5-diethylaminophenol	Spec determination of the complex in a sulfuric acid medium in the presence of ethanol
Dithizone	Volumetric determination of palladium with dithizone in acid medium after extraction of its dimethylglyoxime complex with chloroform; PAS determination of the dithizone extraction solution into a thermally thin solid film
Dithiazone + iodide	Spec determination of palladium with dithizone, by use of an iodide medium in the presence of sulfite at pH = 3 to 5, to separate platinum
Dithizone + stannous chloride	Extractive separation and spec determination of palladium in the presence of stannous chloride to separate platinum
Isonitrosobenzoylacetone	Radiochemical separation and determination of palladium in complex matrices employing substoichiometric thermal NAA
2-Nitroso-1-naphthol	Spec λ = 370 nm of the violet complex
4-(2-Pyridylazo)resorcinol	Spec determination of complex at both pH = 7.2 to 7.9 and in 1 M H_2SO_4
4-(2-Pyridylazo)resorcinol + diphenylguanidine	Spec determination after extraction of the red Pd(II) chelate with 4-(2-pyridylazo)resorcinol in the presence of *N,N′*-diphenylguanidine into *n*-butanol
Platinum	
N-Phenylbenzimidoylthiourea (PBITU)	Flow injection analysis spec λ = 345 nm of the Pd:PBITU complex in (0.2 to 2.0) M HCl in 10% (vol/vol) ethanol solution
Dithizone + iodide	Spec determination of platinum with dithizone, by use of an iodide medium in the presence of sulfite at pH = 3 to 5, to separate palladium
Dithizone + stannous chloride	Extractive separation and spectrophotometric determination of platinum in the presence of stannous chloride to separate palladium
2-Mercaptobenzothiazole	Radiochemical separation and determination of platinum complex matrices employing substoichiometric thermal NAA
Protactinium	
Arsenazo III	Spec λ = 680 nm of the complex after extraction with 7 N H_2SO_4 and isoamyl alcohol
EDTA + tannic acid	Gravimetric analysis of the tannic acid precipitate (pH = 5.0)
Rhenium	
2,2′-Furildioxime	Spec λ = 532 nm of the complex
N,N-Diethyl-*N′*-benzoylthiourea	Spec λ = 383 nm of the green complex in hydrochloric acid medium in the presence of tin(II) chloride
Tin(II)	Spectrophotometric titration for the determination of rhenium by use of tin(II) as the titrant

Reagents	Results
Rhodium	
1,5-Diphenylcarbazide	Spec determination of the complex after isobutyl alcohol extraction (pH = 5.0)
p-Nitrosodimethylaniline	Spec λ = 510 nm of the cherry-red binary complex (pH = 4.4)
1-(2-Pyridylazo)-2-naphthol	Spec λ = 598 nm of the green complex (pH = 5.1) after chloroform extraction
Ruthenium	
4-Benzylideneamino-3-mercapto-6-methyl-1,2,4-triazine (4H)-5-one	Spec λ = 620 nm
1,10-Phenanthroline	Chemiluminescence determination of chlorpheniramine by use of tris(1,10-phenanthroline)-ruthenium(II) peroxydisulfate system and sequential injection analysis; spec determination of the complex after reducing Ru(IV) to Ru(II)
Thiourea	Spec λ = 640 nm of ruthenium complex in carbon supported Pt-Ru-Ge catalyst in 5 M HCl
1,4-Diphenylthiosemicarbazide	Spec determination of the bright red complex
Scandium	
Alizarin red S	Cathodic adsorptive stripping of the scandium-alizarin red S complex onto a carbon paste electrode
Ammonium purpurate	Spec determination of scandium with ammonium purpurate as a chromogenic reagent
Chrome azurol S	Spec determination of the binary complex
Xylenol orange	Spec λ = 553 nm of the binary mixture
Selenium	
3,3′-Diaminobenzidine	Spec λ = 350 nm of the yellow complex (pH = 3.0)
2,3-Diaminonaphthaline	Fluorometric determination of the binary complex in water
Thiourea	Determination of selenium by hydride generation inductively coupled plasma atomic emission spectrometry
Silver	
Dithizone	Graphite-furnace atomic-absorption spectrophotometric determination of silver on suspended dithizone particles from acidic sample solutions with ultrasonics to facilitate the separation
Eosin + 1,10-phenanthroline	Spec λ = 540 nm to 555 nm of the 1,10-phenanthroline (PHEN) and eosin (2,4,5,7-tetrabromofluorescein) association complexes
Strontium	
Phthalein purple	High-performance chelation ion chromatography involving dye-coated resins
Tantalum	
N-Benzoyl-*N*-phenylhydroxylamine	Separation and determination of the complex from a tartrate solution at pH < 1.5
Crystal violet (CV) + *N,N′*-diphenylbenzamidine (DPBA)	Spec λ = 600 nm of Ta(V)-F-CV+ cation complex with a benzene solution of DPBA from sulfuric acid solution
O-Hydroxyhydroquinonephthalein (Qnph) + hexadecyltrimethyl-ammonium chloride (HTAC)	Spec λ = 510 nm of the complex in strong acidic media
Malachite green	Spec λ = 623 nm of the complex in HF after extraction with benzene or toluene
Methyl violet	Spec determination of the complex
4-(2-Pyridylazo)resorcinol + citrate	Determination of the ternary complex by ion-interaction reversed-phase HPLC on a C18 column in 5 mM citrate buffer (pH = 6.5, λ = 540 nm)
Phenylfluorone	Spectrophotometric determination from HF-HCl solution with methyl isobutyl ketone
Victoria blue	Spectrophotometric determination of the complex after benzene extraction
Tellurium	
Ammonium pyrrolidinedithiocarbamate	Differential determination of tellurium(IV) and tellurium(VI) by AAS with a carbon-tube atomizer
Bismuthiol II	Spec λ = 330 mm of the yellow complex in acidic medium (pH = 3.5) after chloroform extraction
Dithizone	Differential determination of tellurium(IV) and tellurium(VI) by AAS with a carbon-tube atomizer
Sodium diethyldithiocarbamate	Differential determination of tellurium(IV) and tellurium(VI) by AAS with a carbon-tube atomizer
Thiourea	Determination of selenium by hydride generation inductively coupled plasma atomic emission spectrometry
Thallium	
Brilliant green	Spec determination of the binary complex after toluene extraction
Dithizone	Spec λ = 505 mm of the complex after chloroform extraction from a citrate-sulfite-cyanide medium at pH = 10.6
8-Hydroxyquinoline	Spectrophotometric determination of the metal-ligand complex
Rhodamine B	Fluorimetric determination of thallium (in silicate rocks) with rhodamine B after separation by adsorption on a crown ether polymer
Rhodamine B hydroxide	Spec λ = 565 nm via oxidation of rhodamine B hydrazide by thallium(I) in acidic medium to give a pinkish-violet radical cation
Thorium	
Arsenazo III	Spec determination of the arsenazo III complex in 10 M HCl or H_2SO_4

Reagents	Results
Eriochrome cyanine R (ECR)	Spec λ = 540 nm of the binary complex
Thoron	Spectrophotometric determination of binary complex in tartaric acid
Xylenol orange	Spec λ = 570 nm of the binary complex (pH = 4.0)
Xylenol orange + CTAB bromide	Spec λ = 600 nm of the complex sensitized by CTMAB (pH = 2.5)
Tin	
Catechol violet + CTAB bromide	Spectrophotometric determination of the green complex
Pyrocatechol violet (and + CTAB bromide)	Spec λ = 660 nm of the complex (pH = 2.0)
Gallein	Spectrophotometric determination of complex in acid medium
Phenylfluorone	Spec determination of the complex (pH = 1) in 36% aqueous ethanol after a preliminary solvent extraction of the tin as the iodide
Toluene-3,4-dithiol + dispersant	Spec determination of the complex
Titanium	
Chromotropic acid	Spec λ = 443 nm of the complex by use of a flow injection manifold
Diantipyrinylmethane	Spec λ = 390 nm of the yellow complex
3-Hydroxy-2-methyl-1-(4-tolyl)-4-pyridone (HY)	Spec λ = 355 nm of the ternary complex formed in perchloric acid and is extracted by chloroform
Methylene blue-ascorbic acid redox reaction	Spec λ = 665 nm of the titanium-methylene blue-ascorbic acid redox reaction
Tiron	Spec λ= 420 nm of the yellow Tiron derivative (pH = 5.2 to 5.6)
Tungsten	
Cyanate	Spectrophotometric determination of tungsten with thiocyanate after both tungsten(VI) and molybdenum(VI) are extracted into chloroform as benzoin α-oxime complexes
Pyrocatechol violet	Determination of the 2:1 green complex in acid medium which is fixed on a dextran-type anion-exchange resin (Sephadex QAEA-25) by first-derivative solid-phase spectrophotometry (λ = 674 nm)
Tetraphenylarsonium chloride + thiocyanate	Gravimetric determination of tungsten with tetraphenylarsonium chloride after its extraction as thiocyanate (pH = 2 to 4)
Toluene-3,5-dithiol	Spec λ = 630 nm of the toluene-3,4-dithiol derivative after extraction with isoamyl acetate
Uranium	
Arsenazo III (1,8-dihydroxynaphthalene-3,6-disulfonic acid-2,7-bis[(azo-2)-phenylarsonic acid])	Spec determination of the binary complex
2-(5-Bromo-2-pyridylazo) diethylaminophenol	Spec λ = 578 nm of the complex (pH = 7.6)
Chlorophosphonazo III	Spec λ = 673 nm of the complex after extraction into 3-methyl-1-butanol from (1.5 to 3.0) M HCl
8-Hydroxyquinoline	Spectrophotometric determination of the metal (UO_2 (II))-ligand complex
2-(2-Pyridylazo)-5-diethylaminophenol (PADAP)	Spec λ = 564 nm of the complex after extraction into methyl isobutyl ketone (pH = 8.2)
1-(2-Pyridylazo)-2-naphthol (PAN)	Spec λ = 560 nm of the deep red precipitate in ammoniacal solutions extracted with chloroform
4-(2-Pyridylazo)-resorsinol (PAR)	Spec λ = 530 nm of the intensely deep red complex after extraction into methyl isobutyl ketone (pH = 8.0)
2-(2-Thiazolylazo)-*p*-cresol + surfactants	Spec λ = 588 nm of the complex (pH = 6.5) with surfactants such as Triton X-100 or N-cetyl-*N,N,N*-trimethyl ammonium bromide (CTAB)
Vanadium	
Chrome azurol S	Spectrophotometric determination of the binary complex
N-Benzoyl-*N*-phenylhydroxylamine	Spec determination of the violet complex in acidic medium
3,5-Dinitrocatechol (DNC) + brilliant green	Extraction-spectrophotometric determination of the system V(V)- 3,5-dinitrocatechol (DNC)-brilliant green chelate complex
8-Hydroxyquinoline (oxine)	Extraction with *n*-butanol and spec λ = 390 nm of a ternary complex (vanadium:oxine:*n*-butanol = 1:2:2)
8-Hydroxyquinoline-5-sulfonic acid and phenylfluorone	Diffuse reflection spectrometry with 8-hydroxyquinoline-5-sulfonic acid and phenylfluorone after sorbing on a disk of an anion exchange fibrous material
4-(2-Pyridylazo)resorcinol (PAR)	Spec determination of the binary complex based on the extraction tetraphenylphosphonium or tetraphenylarsonium chloride
Xylenol orange	Spec λ = 490 nm of chelate (pH = 5.0)
Yttrium	
Alizarin red S	Spec λ = 550 nm of the complex
Ammonium purpurate	Spec determination of yttrium with ammonium purpurate as a chromogenic reagent
Arsenazo III	Spec λ = 660 nm of the blue-colored complex after preliminary purification with hydroxide and subsequent acidification
Eriochrome cyanine R (ECR)	Spec λ = 540 nm of the binary complex
Pyrocatechol violet	Spec λ = 665 nm of the complex
Zinc	
2-(5-Bromo-2-pyridylazo)-5-diethylaminophenol	Spec determination by use of 2-(5-bromo-2-pyridylazo)-5-diethyl aminophenol in the presence of cationic surfactant cetylpyridinium chloride

Reagents	Results
Carbonic anhydrase	Enzymatic determination by use of carbonic anhydrase after removing zinc by dialysis against dipicolinic acid
Dithizone	Spec λ = 530 nm of binary complex after chloroform extraction
Eriochrome black T + EDTA	Complexometric titration where the initially formed red zinc-eriochrome black T color is replaced with the blue zinc-EDTA color at the end point (pH = 10)
7-(4-Nitrophenylazo)-8-hydroxyquinoline-5-sulfonic acid (*p*-NIAZOXS)	Spec λ = 520 nm of the zinc derivative (pH = 9.2, borax buffer)
Phenylglyoxal mono(2-pyridyl) hydrazone (PGMPH)	Spec λ = 464 nm to 470 nm of the yellow-orange complex (pH = 7.2 to 8.5) in 40% (v/v) ethanol
1-(2-Pyridylazo)-2-naphthol (PAN)	Two-dimensional absorption spec determination of complex in aqueous micellar solutions
1-(2-Pyridylazo)-2-naphthol (PAN)	Preconcentration determination by use of 1-(2-pyridylazo)-2-naphthol (PAN) anchored. SiO_2 nanoparticles
4-(2-Pyridylazo)resorcinol	Spec determination at pH = 7.0; preconcentration of zinc by cloud point extraction of the complex and determination by ICP optic emission spectrometry
1-(2-Thiazolylazo)-2-naphthol (TAN)	Flow-injection solid phase spec λ = 595 nm with TAN immobilized on C18-bonded silica
Xylenol orange	Spec determination of 1:1 zinc-xylenol orange red-violet complex (pH= 5.8 to 6.2)
Xylenol orange	Sequential injection analysis (SIA) based on the spec λ = 568 nm of zinc by use of xylenol orange as a color reagent
Xylenol orange	Spec determination by mean centering of ratio kinetic profile (pH = 5.3)
Xylenol orange + cetylpyridinium chloride	Spec λ = 580 nm of the 1:2:4 ratio for the metal:ligand:surfactant ternary complex (pH = 5.0 to 6.0)
Zirconium	
Alizarin red S	Spec determination of the binary complex after phosphate extraction
Arsenazo III (1,8-dihydroxynaphthalene-3,6-disulfonic acid-2,7-bis[(azo-2)-phenylarsonic acid])	Spec determination of the binary complex
N-p-Chlorophenylbenzohydroxamic acid (*N-p*-Cl-BHA) + morin	Spec λ = 420 nm and fluorimetric determination of the *N-p*-Cl-BHA greenish-yellow complex after extraction with isoamyl alcohol from (0.2 to 0.5) N H_2SO_4 followed by morin addition; it is critical that the morin be very pure
Pyrocatechol violet	Spec λ = 650 nm of the blue complex in sulfuric acid solution
Pyrocatechol violet + tri-*n*-octylphosphine oxide (TOPO)	Spec λ = 655 nm of the blue complex after extraction with tri-*n*-octylphosphine oxide (TOPO) in cyclohexane
Morin	Fluorimetric determination of the complex after EDTA addition
Xylenol orange	Flow injection spectrophotometric determination in sulfuric acid medium

II. Anions

Method	Results/Comments
Arsenate, AsO_4^{-3}	
X-ray absorption near edge structure (XANES)	Use of self-consistent multiple-scattering methods that measure the AsO_4^{-3} adsorption on TiO_2
Dual detection ion chromatography	Simultaneous determination of AsO_4^{-3} and AsO_3^{-3} (LOD = 0.044 mg/L)
Ion chromatography/inductively-coupled plasma/MS	Validation established after ultrasonic-assisted enzymatic extraction
Ion chromatography	Post-column generation and detection of the AsO_4^{-3} molybdate heteropoly ion
Surface-enhanced Raman scattering (SERS)	Use of Ag nanostructured multilayer films; LOD = 5 µg/L
Liquid chromatography-atomic fluorescence detection	Simultaneous determination of six As ions; LOD < 4 µg/L
LC-ICP/MS	Simultaneous determination of five As ions; LOD < 4 µg/L
HPLC/hydride generation atomic absorption	Simultaneous determination of six As ions; LOD = 3 ng to 9 ng
Ion exchange determination	Separation of AsO_4^{-3} and AsO_3^{-3} using the weakly basic anion exchanger A63-X4A by difference of respective pK_a values
Titration	As^{+5} is reduced by NH_2NH_2 and titration with Br^-/BrO_3^-
Bromide, Br^-	
Ion chromatography using electrochemical detection	Use of Ag working electrode; LOD = 10 ppb (mass/mass)
Carbonate, CO_3^{-2}	
GC	Carbonation of salt and use of a GC with methanation reformer and a flame ionization detector
GC-MS	Determination of pentafluorobenzyl derivative
FTIR	CO_3^{-2} measurement in organic matter (875 cm^{-1} and 712 cm^{-1})
Gas measurement	Conversion to CO_2 measured by a barometer or manometer
Ion chromatography	Measurement in the presence of formyl ions
Photoacoustic IR spectroscopy	Use of several multi-calibration methods typically in sedimentary rocks
Thermal optical analysis	Use of semi-continuous carbon elemental analyzer
Liquid chromatography	Use of a C18 HPLC column, MeOH/AcOH mobile phase and UV detection (λ = 290 nm)
Raman spectroscopy	Use of OH stretch band of H_2O as internal standard

Method	Results/Comments
Thermogravimetry	CO_3^{-2} measurement in organic matter after identification of evolved gaseous species
Chlorate, ClO_3^-	
Flow injection analysis	Reduction of methylene blue's leuco form to methylene blue followed by optical detection in the visible region
Spectrophotometry	Reduction to Cl_2 via Tl^{+3} which oxidizes the leuco form of methylene
FTIR	Absorption band at 973 cm^{-1} (λ = 10 277 nm)
Anodic electrochemical dissociation	Determination made during the anodic dissociation of Ti grade VT-1
Potentiometric titration	Reduction to Cl^- (pH = 7) using As^{+3} (OsO_4 as catalyst)
Titrimetric analysis	ClO_3^- converted to Cl^- which is titrated against $Hg(NO_3)_2$ (diphenylcarbazone as indicator)
Titrimetric analysis	Iodometric titration
Titrimetric analysis	Use of methyl orange (LOD = 10^{-2} µg, mass/mass)
Chromate, CrO_4^{-2}	
Potentiometric titration	Selective electrode based on the N,N-butylenebis (salicylideneiminato)copper(II); LOD = 3.0×10^{-6} mol/L
Spectrophotometry	Determination by oxidation of ascorbic acid (λ = 548 nm)
Ion exchange chromatography	Diaminetetraacetic acid (DCTA)/ CH_3CN used as eluent
Ion pair chromatography	Tetrabutylammonium hydroxide (TBAH)/aq. CH_3CN used as eluent
Capillary electrophoresis	KH_2PO_4 buffer (pH = 7)
Titration	Iodometric titration
X-ray absorption near edge structure (XANES)	LOD = 10 ppm using a 150 µm synchrotron X-ray beam
Cyanide, CN^-	
Headspace GC/MS	Use of gas chromatography with a silica PLOT column coupled with mass selective detection
Headspace GC/MS	Use of gas chromatography with a nitrogen-phosphorus detector; LOD = 0.05 µg/mL to 5 µg/mL
Headspace GC/MS	Use of headspace solid-phase microextraction (SPME); LOD = 0.006 µg/mL
Headspace GC/MS	Determined as the pentafluorobenzylbromide derivative in the presence of TDMBC
Headspace GC	Use of GC with thermoionic detection (NPD)
Headspace GC/MS	Use of GC with the flame ionization detector (FID)
Headspace GC/MS	Determination after reaction with chloramine-T Derivatization by the pyridine-pyazolone method
Ion chromatography using electrochemical detection	Use of Ag working electrode; LOD = 1 µg/L
Cyclic voltammetry	Au electrode; LOD = 10^{-5} mol/L to 10^{-6} mol/L
Differential cathodic stripping voltammetry	LOD = 2×10^{-7} M in the presence of 5×10^{-5} M [S^{-2}] and 1×10^{-3} M [Cu^{+2}]
Differential electrolytic potentiometry (DEP)	DEP coupled with the sequential injection/flow analysis (SIA/FIA) of aqueous solutions; con. range 6 µg/mL to 39 µg/mL; LOD = 0.31 µg/mL; RSD = 2.55
Isotachophoresis	Determination as [$Au(CN)_2^-$], [$Ag(CN)_2^-$], or [$Cu(CN)_3^{-2}$] complexes
Potentiometric determination	Use of PVC sensors responsive to $Ag(CN)_2^-$
Spectrofluorometry	Use of naphthoquinone imidazole boronic-based sensors (M-NQB and p-NQB) with CTAB (spec λ = 460 nm)
Fluorescence	Derivatization with naphthalene 2,3-dicarboxyaldehyde and taurine (specf λ_{ex} = 418 nm, λ_{em} = 460 nm); LOD = 0.002 µg/mL to 0.025 µg/mL
Argentometric method	Argentometric titration/ quantification using KCNS ($FeNH_4SO_4$) as indicator
Capillary electrophoresis/UV spectrophotometry	Conversion of CN^- to SCN^- via rhodanese, separated by capillary electrophoresis and measured by UV spectrophotometry (spec λ = 200 nm); LOD = 3 µmol
Piezoelectric quartz crystal (PQC) sensors	Method makes use of silver coated sensors; LOD = 1.25×10^{-8} mol/L
Visible spectrophotometry colorimetric assay	Picrate/resorcinol derivative in bicarbonate (spec λ = 488 nm)
Visible spectrophotometry colorimetric assay	Lithium/sodium picrate derivative (spec λ = 500 nm to 520 nm); LOD = 2.5 µg/100 mg sample
Visible spectrophotometry colorimetric assay	Isonicotinic acid-barbituric acid derivative after treatment with chloramine-T (spec λ = 600 nm)
Visible spectrophotometry colorimetric assay	4-hydroxy-3-(2-oxoindoline-3-ylideneamino)-2-thioxo-2H-1,3-thiazin-5(3H)-one) HOTT derivative (spec λ = 466 nm)
Visible spectrophotometry colorimetric assay	Ethanol extraction of the red complex formed on picric acid test strips (spec λ = 500 nm); LOD = 0.5 µg to 1.0 µg
Visible spectrophotometry colorimetric assay	Derivatization with *p*-nitrobenzaldehyde followed by reaction with o-dinitrobenzene to yield a purple color; LOD = 10 µg/L
Visible spectrophotometry colorimetric assay	Barbituric or N,N-dimethyl-barbituric acid derivative
Visible spectrophotometry colorimetric assay	Spectrophotometric determination by use of a modified Konig reaction with NaOCl as the chlorinating agent
Visible spectrophotometry colorimetric assay	Complexation with pyridine or 4-pyridinecarboxylic acid
Visible spectrophotometry colorimetric assay	Reaction of CN^- with Pd-dimethyl-glyoximate complex that releases dimethylglyoxime, isolated as the Ni derivative

Method	Results/Comments
Visible spectrophotometry colorimetric assay	Determination (spec λ = 570 nm) of pyridine/barbituric acid derivative after chloramine-T derivative
Visible spectrophotometry colorimetric assay	Measurement of the pyridine-pyrazolone derivative
Visible spectrophotometry colorimetric assay	Measurement of the isocotinic acid/1-phenyl-3-methyl-5-pyrazolone derivative after reaction with chloramine-T (spec λ = 638 nm)
Visible spectrophotometry colorimetric assay	Measurement of the derivative with the Hg(II)-*p*-dimethyl-aminobenzylidenerhodanine complex (spec λ = 452 nm)
Visible spectrophotometry colorimetric assay	Measurement of the Hg(II)-diphenylcarbazone derivative (spec λ = 562 nm)
Visible spectrophotometry colorimetric assay	Measurement of the pyridine-benzidine complex; LOD = 0.02 µg
Visible spectrophotometry colorimetric assay	Measurement of the pentacyano(N-methylpyrazinium) ferrate (II) complex (spec λ = 658 nm)
Flow injection analysis	Use of Ag and Pt electrodes to determine CN^- as Cu complexes
Flow injection analysis	Analyzed as the teracyanonickelate (II) complex
Fluorescent sensors	Fluoresecein derivative emits a green light
Fluorescent sensors	Naphthoquinone-imidazole boronic-based sensors (spec λ = 460 nm); LOD = 1.4 µM
FTIR	Use of a horizontal attenuated total reflectance (HATR) accessory; detection range = 0.3 M to 1.0 M
Chemiluminescence	Measurement of intensity of the reaction with luminal, hemin, and peroxide
Amperometry/flow injection analysis	Use of a multimeter as a detection device; LOD = 200 µg/L
Photoacoustic IR detection	Applied to the determination of HCN and NCCl in air
X-ray diffraction	LOD = 0.1% in waste-water analyses
Coulometric determination	LOD = 10^{-9} mg/100 µL
Cavity ringdown spectroscopy	Use of external cavity tunable diode laser
CN^-/SCN^- (only)	
Chemical ionization GC/MS	Derivatization with pentafluorobenzyl bromide (PFBBr) via extraction with ethyl acetate and tetrabutylammonium sulfate (TBAS); LOD = 1 µM (CN^-) and LOD < 50 nM (SCN^-)
Dichromate, $Cr_2O_7^{-2}$	
FTIR	Absorption band at 950 cm^{-1}
Paper electrophoresis-photo density scanning	Photo density scanning determination after development with diphenyl carbazide
Cell voltage variation	Applied to the electrochemical synthesis of sodium dichromate from sodium chromate
Conductimetric determination	Performed in the presence of CrO_4^{-2}
Adsorptive stripping voltamemtry	Commonly applied to body fluids
Potentiometric titration	Determination of Pu via the Fe^{+2}/$Cr_2O_7^{-2}$ redox titration
Sequential injection analysis	$Cr_2O_7^{-2}$ determination based on oxidation of pindolol (spec λ = 640 nm)
Spectrophotometric analysis	Applied to the determination of pyridine derivatives
	Reduction to Cr^{+3} in organic carbon soil analysis
Titrimetric analysis	Reduction by Fe^{+3} titration
Thin-layer chromatography (TLC)	Applied to determination of unsaturated fats and further spectrophotometric analysis (spec λ = 350 nm)
X-ray absorption fine structure spectroscopy	Applied to the speciation of CrO_4^{-2}/$Cr_2O_7^{-2}$ equilibrium
Hypochlorite, ClO^-	
Titrimetric determination	Iodometric titration
Polarography	Determination by conversion of Br^- to BrO_3^-
Spectrophotometry	Oxidation of Ir^{+3} to Ir^{+4} (spec λ = 488 nm)
Spectrophotometry	Measurement of ClO^- absorbance at pH > 7
Spectrophotometry	Measurement of chloramine formed by addition of aq. NH_3
Voltammetry	Technique compared to iodometric titration
Potentiometric titration	ClO^- measured by subtraction of BrO^- in a ClO/BrO^-
Potentiometric titration	Reduction to Cl^- (pH < 7, OsO_4 as catalyst)
Iodide, I^-	
Ion chromatography using electrochemical detection	Use of Ag working electrode; LOD = 100 ppb
Isocyanates, NCO^-	
Mass spectrometry	Use of a proton transfer reaction (PTR), time-of-flight mass spectrometer and high sensitivity PTR quadruple mass spectrometer
FTIR	Use of sealed liquid cell for polymer analysis
HPLC	Analysis of ethanol derivative (spec λ = 245 nm)
Capillary electrophoresis	Use of tris(2,2'-bipyridine) ruthenium (II) by electrochemiluminescence
Potentiometric titration	Titration of carboxylic acid hydrazide derivative with $NaNO_2$
Spectrophotometric analysis	Conversion of CH_3NCO to CH_3NH_2 and reaction with 1 fluoro-2,4-dinitrobenzene to yield $CH_3NHC_6H_3(NO_2)_2$ (spec λ = 352 nm)
Manganate, MnO_4^{-2}	
Titrimetric analysis	Oxidation of As^{+3}, Cr^{+3}, Sb^{+3}, Te^{+4}, PO_3^{-3}, various carboxylic acids, trimethylammoniated compounds
Gravimetric analysis	Precipitation of $BaMnO_4$
Potentiometric titration	Use of a Pt electrode
Voltammetry	Use of glassy carbon working electrode
Spectrophotometry	LOD = 0.185 µg/mL; (spec λ = 635 nm)
Anodic oxidation	Rotating disk electrode

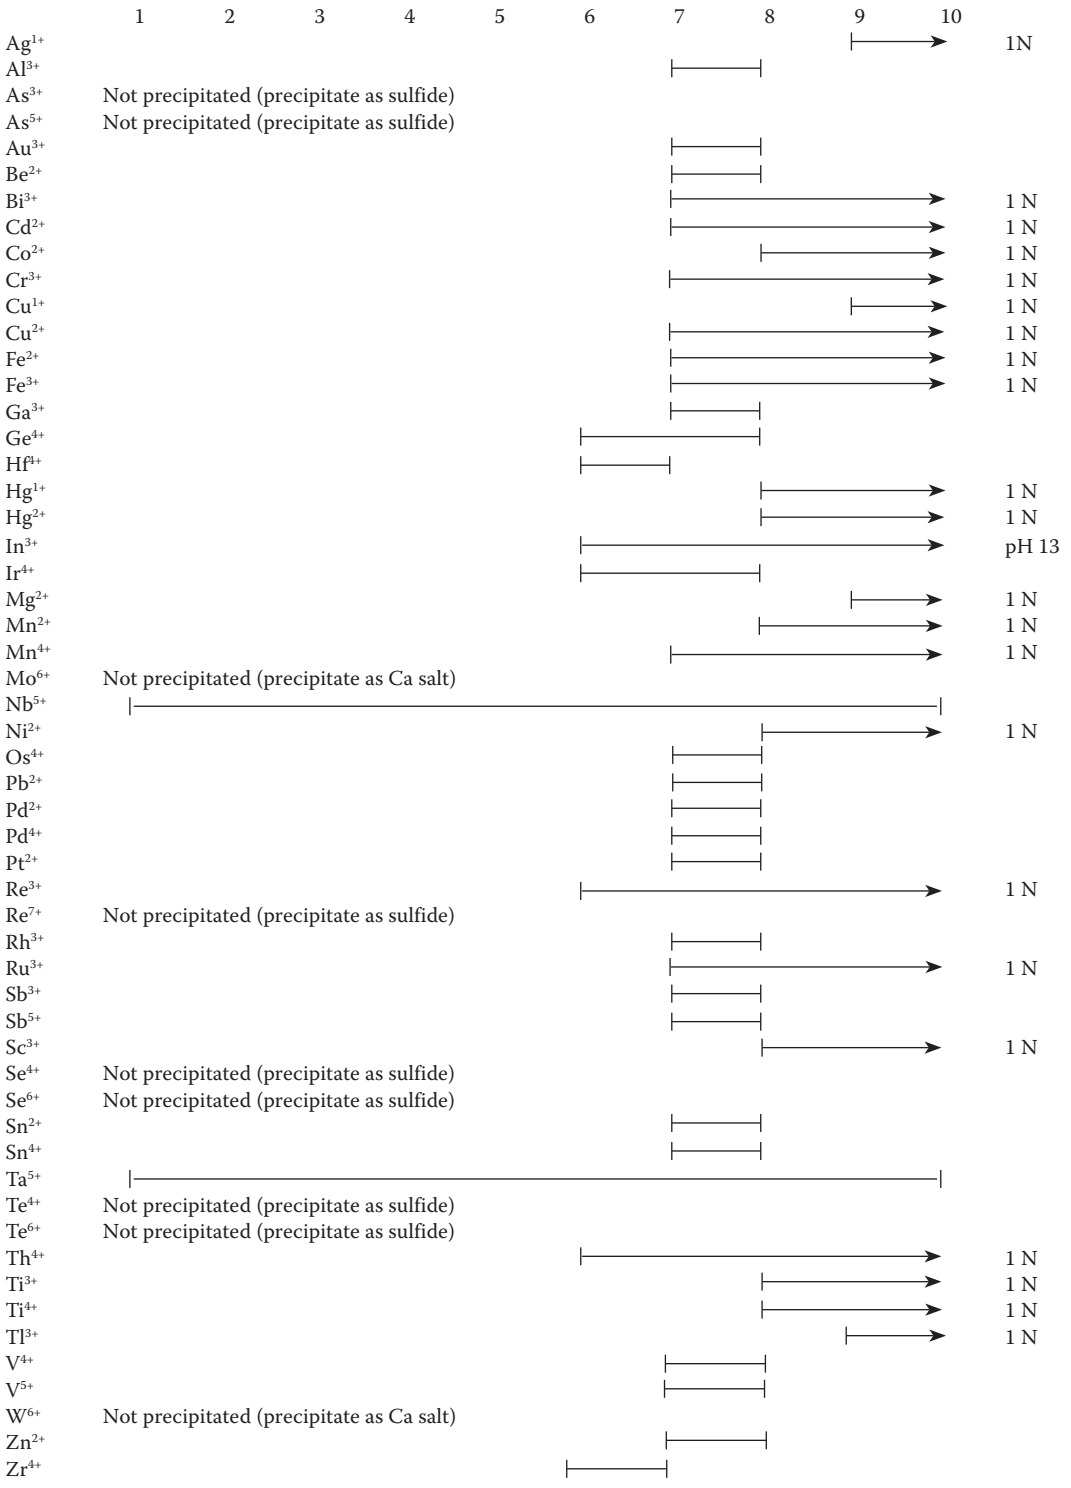
Method	Results/Comments
Gravimetric analysis	Precipitation of $BaMnO_4$
Nitrite, NO_2^-	
Ion chromatography	Use of high capacity, OH^--selective, anion exchange column with a guard column) in simultaneous determination of BrO_3^-; LOD = 0.05 µg/L; RSD = 3.61 % to 4.77 %
HPLC	Simultaneous determination of NO_3^-, SO_4^{-2}, and SCN^-; samples are ultrasonically extracted with EtOH/CCl_3COOH and purified by C18 SPE column (highly retentive alkyl-bonded phase); LOD = 0.01
HPLC	KOH or NaOH aq. solution used as mobile phase for 10 µL to 25 µL sample size
Quantitative sequential injection analysis (SIA)	LOD = 0.002 mg/L
Diffuse UV-visible reflectance method	Reaction of nitrite with sulphadiazine and *o*-naphthol; LOD = 0.02 mg/L; RSD = 5% to 8%
Cyclic voltammetry (CV)/pulse voltammetry	Electropolymerization of Nile Blue at pre-polarized glassy carbon electrode (phosphate buffer, pH = 7.1) leading to a NO_2^- sensor
Cyclic voltammetry (CV)/pulse voltammetry	Use of a solid-state microelectrode formed through the electrochemical co-deposition of Pt-Fe nanoparticles on Au microelectrode
Cyclic voltammetry (CV)/pulse voltammetry	Use of a sol-gel electrode using 3-aminopropyltrimethoxy silane for covalent immobilization of toluidine blue
Capillary electrophoresis	Simultaneous determination of NO_3^- and $C_2O_4^{-2}$
Capillary zone electrophoresis	Simultaneous determination of NO_3^- and Cl^- by use of a photoiodie-array detector (PDA)
UV-visible spectrophotometry	Derivatization with $Zn(OH)_2$/basic fuchsin
UV-visible spectrophotometry	Derivatization with Griess reagent (spec λ = 537 nm); RSD ~1.5 %
Microfluidic gradient elution moving boundary electrophoresis (GEMBE)	Simultaneous determination of NO_3^- and NH_4^+
Microfluidic gradient elution moving boundary electrophoresis (GEMBE)	Simultaneous determination of NO_3^-, Cl^-, $C_2O_4^{-2}$, NO_3^-, and SO_4^{-2}
Gasometric analysis	The NO_2^- concentration is quantified by the formation of N_2(g) produced *vis a vis* its reaction of with sulfamic acid
Seeping layer test paper	Derivatization with *p*-aminobenzenesulfonic acid/*N*-(1-naphthyl) ethylenediamine dihydrochloride
NO_2^- simultaneous NO_2^-/NO_3^- (only)	
HPLC	Pre-column derivatization with Griess reagents (spec λ = 540 nm)
UV-visible spectrophotometry	Following derivatization with HCl/naphthyl ethylenediamine
	LOD = 0.5 mg to 18 mg nitrogen per L (NO_3^-) and 0.5 mg to 5 mg nitrogen per L (NO_2^-)
HPLC-UV	LOD = 2.5 mg/kg (NO_3^-) and 5.0 mg/kg (NO_2^-)
GC-mass spectrometry	Quantification of ^{15}N-labeled nitrate and nitrite biological fluids
Chemiluminescence	LOD = 10 nmol/L; RSD = 3 % (200 nmol/L) to 5% (400 nmol/L)
Oxalate, $C_2O_4^{-2}$	
Capillary electrophoresis	Use of acid run buffer to revert electroosmotic flow
Capillary gas chromatography	LOD = 500 µg by use of a flame ionization detector
Chromogenic strip	Test strip equipped with sorghum leaf oxalate oxidase cross-linked with glutaraldehyde and *o*-toluidine
FT-IR (attenuated)	LOD = 0.07% of the matrix
Capillary electrophoresis	Use of acid run buffer to revert electroosmotic flow
Capillary gas chromatography	LOD = 500 µg by use of a flame ionization detector
Flow injection analysis	Oxalate oxidase and peroxidase are immobilized on Au electrode
Gas chromatography	Analysis of methylated product
Ion exchange chromatography method	LOD = 6 µg/L to 9 µg/L
Isotachophoresis	Detection at λ = 254 nm; LOD = 20 nmol/L
LC-tandem MS	System attached to online weak anion exchange chromatography
Raman spectroscopy	Intensity of peak at 1462 cm^{-1} is used
Spectrophotometric analysis	Analysis of catalytic effect of reaction products of methylene blue/$Cr_2O_7^{-2}$
Spectrophotometric analysis	Analysis of the NaDH → NAD^+ reaction with $C_2O_4^{-2}$
Titrimetric analysis	Titration against MnO_4^-
Titrimetric analysis	Titration against Ce^{+4}
Perchlorate, ClO_4^-	
Spectrophotometric analysis	Analysis of catalytic effect of reaction products of methylene blue/$Cr_2O_7^{-2}$
Spectrophotometric analysis	Analysis of the NaDH → NAD^+ reaction with $C_2O_4^{-2}$
Titrimetric analysis	Titration against MnO_4^-
Titrimetric analysis	Titration against Ce^{+4}
Spectrophotometry	Yb-pyrocatechol violet complex
Spectrophotometry	Determination of reddish-violet color produced by adding methylene blue/$ZnSO_4$ in presence of NO_3^-
HPLC/MS	LOD = 0.2 ppb
Capillary electrophoresis	Analysis typically performed on tobacco plants
MS	Determination of organic base-phosphate complex
Ion pair extraction-MS ESI	Use of cationic surfactants
Titrimetric analysis	Titration against H-tetramethyl-ammonium sulfate with various indicators
Titrimetric analysis	Back titration of excess $TiCl_3$ against $Fe_2(SO_3)_2$
Phosphate, PO_4^{-3}	
FTIR	Use of 1037 cm^{-1} ($Ca_3(PO_4)_2$) and 1010 cm^{-1} ($MgNH_4PO_4$)

Method	Results/Comments
Phosphide, P^{-3}	
Gravimetric	Derivatization as Ag_3PO_3 after formation of Ag_3P and further oxidation with HNO_3
ESR	Derivatization to GaP
X-ray electron spectrometry	Derivatization to AlP
X-ray fluorescence	Derivatization to AlP
X-ray diffractometry	Derivatization to AlP
X-ray photoelectron spectroscopy	Derivatization to functionalized GaP
Fluorescence	Derivatization to Ca_3P_2
Phosphite, PO_3^{-3}	
Fluorescence	Enzymatic oxidation to phosphate with NAD^+ as co-substrate to produce fluorescence
^{31}P NMR	Estherification of OH^- in organic polymers
Laser Raman spectrometry	Ar-ion laser allows quantitative analysis of $H_2PO_3^-$ and HPO_3^{-2}
Ion exchange chromatography	Method makes use of conductivity detection
Visible spectrophotometry	Measurement of $3,5\text{-}(O_2N)_2C_6H_3COOH$ derivative
Silcate, SiO_4^{-4}	
Raman spectroscopy	Use of *ab initio* quantum chemical simulation
Electron probe microanalysis (EPMA)	Analysis of Na, Mg, Al, Si, K, Ca, Ti, Mn, and Fe salts
Ion-exclusion chromatography	Use of ascorbate solution as both an eluent and a reducing agent following by molybdate derivatization
Laser-induced plasma spectroscopy	Use of a Q switched Nd:YAG laser and time-resolved spectroscopy
Time-of-flight secondary ion mass spectrometry	Use of C60 primary ions
Laser ablation-inductively coupled plasma mass spectrometry (LA-ICPMS)	No need for internal standard
Sulfide, S^{-2}	
Ion chromatography using electrochemical detection	Use of Ag working electrode; LOD = 30 ppb
Sulfite, SO_3^{-2}	
Amperometric titration	Use of iodine solution
Potentiometric titration	Pt wire coated with Hg is balanced against calomel electrode
Spectrophotometric analysis	Product of reaction with *p*-rosaniline acid bleached dye and HCHO (spec λ = 560 nm)
Ion chromatography	
Titration analysis	Titration against BrO_3^{-2}
Coulometric determination	LOD = 10^{-11} mg/100 µL
Thiocyanate, CNO^-	
Flow injection analysis	Formation of the 2-(5-bromo-2-pyridylazo)-5-diethylaminophenol derivative in $Cr_2O_7^{-2}/H^+$
Flow injection analysis	Analyzed as the teracyanonickelate (II) complex

PRECIPITATION OF SULFIDES

Robert Joyce and Blaine C. McKusick

TABLE 1. Precipitation of Sulfides



Precipitated at pH 7	Not precipitated at low pH	Forms a soluble complex at high pH
Ag^{+}		
As^{3+a}		X
Au^{+a}		X
Bi^{3+}		
Cd^{2+}		
Co^{2+}	X	
Cr^{3+a}		
Cu^{2+}		
Fe^{2+a}	X	
Ge^{2+}		X
Hg^{2+}		X
In^{3+}	X	
Ir^{4+}		X
Mn^{2+a}	X	
Mo^{3+}		X
Ni^{2+}	X	
Os^{4+}		
Pb^{2+}		
Pd^{2+a}		
Pt^{2+a}		X
Re^{4+}		
Rh^{2+a}		
Ru^{4+}		
Sb^{3+a}		X
Se^{2+}		X
Sn^{2+}		X
Te^{4+}		X
Tl^{+a}	X	
V^{4+a}		
Zn^{2+}	X	

[a] Higher oxidation states of this ion are reduced by sulfide ion and precipitated as this sulfide.

pH RANGE FOR PRECIPITATION OF METAL HYDROXIDES AND OXIDES

Robert Joyce and Blaine C. McKusick

BOND LENGTHS IN CRYSTALLINE ORGANIC COMPOUNDS

The following table gives average interatomic distances for bonds between the elements H, B, C, N, O, F, Si, P, S, Cl, As, Se, Br, Te, and I as determined from X-ray and neutron diffraction measurements on organic crystals. The table has been derived from an analysis of high-precision structure data on about 10,000 crystals contained in the 1985 version of the Cambridge Structural Database, which is maintained by the Cambridge Crystallographic Data Center. The explanation of the columns is:

Column 1: Specification of elements in the bond, with coordination number given in parentheses, and bond type (single, double, etc.). For carbon, the hybridization state is given.

Column 2: Substructure in which the bond is found. The target bond is set in boldface. Where X is not specified, it denotes any element type. C# indicates any sp^3 carbon atom, and C* denotes an sp^3 carbon whose bonds, in addition to those specified in the linear formulation, are to C and H atoms only.

Column 3: *d* is the unweighted mean in Å units of all the values for that bond length found in the sample.

Column 4: *m* is the median in Å units of all values.

Column 5: σ is the standard deviation in the sample.

Column 6: q_1 is the lower quartile for the sample (i.e., 25% of values are less than q_1 and 75% exceed it).

Column 7: q_u is the upper quartile for the sample.

Column 8: *n* is number of observations in the sample.

Column 9: Notes refer to the footnotes in Appendix 1.

References to special cases are given in a shorthand form and listed in Appendix 2. Further information on the method of analysis of the data may be found in the reference cited below.

The table is reprinted with permission of the authors, the Royal Society of Chemistry, and the International Union of Crystallography.

Appendix 1. (Footnotes to Table)

1. Sample dominated by B–CH_3. For longer bonds in B^-–CH_3 see LITMEB10 [B(4)–CH_3 = 1.621–1.644Å].
2. p(π)–p(π) Bonding with Bsp^2 and Nsp^2 coplanar (τBN = 0 ± 15°) predominates. See G. Schmidt, R. Boese, and D. Bläser, *Z. Naturforsch*., 1982, **37b**, 1230.
3. 84 observations range from 1.38 to 1.61 Å and individual values depend on substituents on B and O. For a discussion of borinic acid adducts see S. J. Rettig and J. Trotter, *Can. J. Chem.,* 1982, **60**, 2957.
4. See M. Kaftory in *The Chemistry of Functional Groups. Supplement D: The Chemistry of Halides, Pseudohalides, and Azides*, S. Patai and Z. Rappoport, Eds., Wiley: New York, 1983, Part 2, ch. 24.
5. Bonds which are endocyclic or exocyclic to any 3- or 4-membered rings have been omitted from all averages in this section.
6. The overall average given here is for Csp^3–Csp^3 bonds which carry only C or H substituents. The value cited reflects the relative abundance of each 'substitution' group. The 'mean of means' for the 9 subgroups is 1.538 (σ = 0.022) Å.
7. See F. H. Allen, (a) *Acta Crystallogr.,* 1980, **B36**, 81; (b) 1981, **B37**, 890.
8. See F. H. Allen, *Acta Crystallogr.*, 1984, **B40**, 64.
9. See F. H. Allen, *Tetrahedron*, 1982, **38**, 2843.
10. See F. H. Allen, *Tetrahedron*, 1982, **38**, 645.
11. Cyclopropanones and cyclobutanones excluded.
12. See W. B. Schweizer and J. D. Dunitz, *Helv. Chim. Acta*, 1982, **65**, 1547.
13. See L. Norskov-Lauritsen, H.-B. Bürgi, P. Hoffmann, and H. R. Schmidt, *Helv. Chim. Acta*, 1985, **68**, 76.
14. See P. Chakrabarti and J. D. Dunitz, *Helv. Chim. Acta,* 1982, **65**, 1555.
15. See J. L. Hencher in *The Chemistry of the C≡C Triple Bond,* S. Patai, Ed., Wiley, New York, 1978, ch. 2.
16. Conjugated: torsion angle about central C–C single bond is 0 ± 20° (*cis*) or 180 ± 20° (*trans*).
17. Unconjugated: torsion angle about central C–C single bond is 20–160°.
18. Other conjugative substituents excluded.
19. TCNQ is tetracyanoquinodimethane.
20. No difference detected between C2 ≃ C3 and C3 ≃ C4 bonds.
21. Derived from neutron diffraction results only.
22. Nsp^3: pyramidal; mean valence angle at N is in range 108–114°.
23. Nsp^2: planar; mean valence angle at N is ≥ 117.5°.
24. Cyclic and acyclic peptides.
25. See R. H. Blessing, *J. Am. Chem. Soc.*, 1983, **105**, 2776.
26. See L. Lebioda, *Acta Crystallogr*., 1980, **B36**, 271.
27. *n* = 3 or 4, i.e. tri- or tetra-substituted ureas.
28. Overall value also includes structures with mean valence angle at N in the range 115–118°.
29. See F. H. Allen and A. J. Kirby, *J. Am. Chem. Soc.*, 1984, **106**, 6197.
30. See A. J. Kirby, 'The Anomeric Effect and Related Stereoelectronic Effects at Oxygen,' Springer, Berlin, 1983.
31. See B. Fuchs, L. Schleifer, and E. Tartakovsky, *Nouv. J. Chim*., 1984, **8**, 275.
32. See S. C. Nyburg and C. H. Faerman, *J. Mol. Struct.,* 1986, **140,** 347.
33. Sample dominated by P–CH_3 and P–CH_2–C.
34. Sample dominated by C* = methyl.
35. See A. Kalman, M. Czugler, and G. Argay, *Acta Crystallogr*., 1981, **B37**, 868.
36. Bimodal distribution resolved into 22 'short' bonds and 5 longer outliers.
37. All 24 observations come from BUDTEZ.
38. 'Long' O–H bonds in centrosymmetric O---H---O H–bonded dimers are excluded.
39. N–N bond length also dependent on torsion angle about N–N bond and on nature of substituent C atoms; these effects are ignored here.
40. N pyramidal has average angle at N in range 100–113.5°; N planar has average angle of ≥ 117.5°.
41. See R. R. Holmes and J. A. Deiters, *J. Amer. Chem. Soc.*, 1977, **99**, 3318**.**
42. No detectable variation in S=O bond length with type of C-substituent**.**

BOND LENGTHS IN ORGANOMETALLIC COMPOUNDS

This table summarizes the average values of interatomic distances of representative metal–ligand bonds. Sigma bonds between *d*- and *f*-block metals and the elements C, N, O, P, S, and As are included. The values are extracted from a much larger list in Reference 1. The tabulated values are the unweighted means of reported measurements on compounds in each category. If four or more measurements are available, the standard deviation is given in parentheses. All values are in Ångstrom units (10^{-10} m).

The first part of the table covers metal–carbon bonds in different ligand categories, while the second part covers metal bonds to other elements. R stands for any alkyl group; Me for a CH_3 group; C_6R_5 indicates an aryl group; and C(=O)R an acyl group. Metals are listed in atomic number order.

STRUCTURE OF FREE MOLECULES IN THE GAS PHASE

David R. Lide

This table gives information on the geometric structure of selected molecules in the gas phase, including the overall geometry, interatomic distances, and bond angles. The molecules have been chosen to provide data on a wide variety of chemical bonds and to illustrate the influence of molecular environment on bond distances and angles. The table is restricted to molecules with conventional covalent or ionic bonds, but it should be pointed out that structure data on many loosely bonded complexes of the van der Waals type have recently become available. The references below contain data on many molecules that are not included here and give additional information such as uncertainties and isotopic variations.

The two techniques for gas phase structure determination are spectroscopy and electron diffraction. The following codes are used to indicate the method used for each set of data:

ED – Gas phase electron diffraction
MW – Microwave spectroscopy, including both measurements in bulk gases and molecular beams
IR – Infrared spectroscopy
R – Raman spectroscopy
UV – Electronic spectroscopy in the ultraviolet and visible regions, including fluorescence measurements
ESR – Electron spin resonance

In some cases, data from two sources have been combined to derive the structure; these are labeled by "ED, MW," for example.

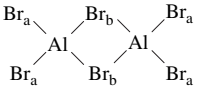
Because of the internal vibrations that are present in all molecules, even in their lowest energy state, the definition of interatomic distance is not a simple matter. The ideal measure is the equilibrium distance in the hypothetical non-vibrating state, designated by r_e. This is the value of the separation of the atoms at the minimum of the potential function that describes the forces between the two atoms. All other measures represent some form of average, generally complex, over the vibrational motions. Since the potential function is asymmetric and less steep at distances beyond the potential minimum, the average distance is normally greater than r_e. Distances determined by electron diffraction (ED) represent an average over all vibrational states that are populated at the temperature of the measurement; the most common measure is designated r_g. Distances determined by spectroscopy (MW, IR, R, or UV) through measurements on the ground vibrational state of the molecule, designated by r_0, describe some form of average, not easily defined, over the zero-point vibrations. Another measure that is frequently used in microwave spectroscopy is the "substitution" distance r_s, which is operationally defined through a series of measurements on different isotopic species. In simple cases, r_s often lies between r_0 and r_e and is therefore a closer approximation to r_e. Several other types of averages have been used; good discussions can be found in Volumes II/25 and II/28 of the *Landolt-Börnstein* series (Reference 1) and in References 4 and 5.

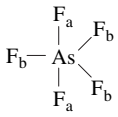
Unless otherwise specified, distances and angles given in this table are r_0 values if the method is spectroscopic and r_g values if the method is electron diffraction. When given, equilibrium and substitution distances are designated by r_e and r_s, respectively.

Many interatomic distances and angles calculated by *ab initio* techniques have been reported in the recent literature. However, it should be emphasized that all data in this table are obtained from direct experimental measurements. In a few cases, *ab initio* calculations of vibration-rotation interaction constants have been combined with the primary experimental measurements to derive r_e values in the table.

The number of significant figures in the values is an indication of the precision of the measurement; thus a distance quoted to three decimal places is probably reliable to about 0.005 Å or better. However, discrepancies between r_e, r_0, and r_g values for the same bond are often the order of 0.01 Å because of vibrational averaging considerations, so care must be taken in comparing bond distances in different molecules. Some distances in simple molecules are given here to four or five decimal places, but little chemical significance can be attached to differences beyond the third decimal place.

The table is presented in two parts: Part 1 covers molecules that do not contain carbon while Part 2 lists carbon-containing molecules. Because many of the entries in Part 1 are free radicals or other transient species whose systematic chemical names are unfamiliar, the listing in Part 1 is in order of chemical formula. Part 2 is ordered by name. In both parts, information on the overall configuration of the molecule is given through structure diagrams and/or indication of the point group of the equilibrium geometry. Subsequent columns give the values of the bond distances and angles; distances are given in Å units, where 1 Å = 10^{-10} m or 0.1 nm, and angles are given in degrees. The last column indicates the experimental method.





The contributions of Kozo Kuchitsu in preparing an earlier version of this table and in giving advice on the new version are gratefully acknowledged.

CHARACTERISTIC BOND LENGTHS IN FREE MOLECULES

David R. Lide

This is a summary of typical bond lengths in gas-phase molecules. The value given for each bond is near the mid-range of values found in simple molecules. Bond lengths usually vary by 1% or 2%, and often by more, depending on the nature of the other bonds attached to the two atoms in question. References 1 and 2 give measured bond lengths in individual gas-phase molecules, as determined by spectroscopic and electron diffraction methods. All bond lengths are given in Å (1 Å = 10^{-10} m).

ATOMIC RADII OF THE ELEMENTS

Manjeera Mantina, Rosendo Valero, Christopher J. Cramer, and Donald G. Truhlar

Atomic radii are not precisely defined, but are nevertheless very widely used parameters in modeling and understanding molecular structure and interactions. Three main classes of radii may be identified: van der Waals radii (which include radii used to characterize steric interactions), covalent radii, and ionic radii. This section is concerned with the first two; ionic radii are covered in another section of the *Handbook* called "Ionic Radii in Crystals."

There are many scales of van der Waals radii, but they are not fully consistent with one another. The van der Waals radii determined by Bondi [1] from x-ray diffraction data, crystal densities, gas kinetic collision cross sections, critical densities, and liquid-state properties are the most widely used values, but Bondi recommended radius values for only 28 of the 44 main-group elements in the periodic table plus 9 transition metals and one actinide. Rowland and Taylor [2] redetermined nine of the main-group radii from crystal structure data and recommended that Bondi's values be accepted except for H, for which they recommended a new value; we accepted their recommendation for H and adopted Bondi's 27 other values for main-group elements. Radii for the 16 remaining main-group elements were determined from electronic structure calculations on selected van der Waals molecules by analyzing the results in a way designed to yield radii compatible with Bondi's scale for main-group elements [3]. Bondi's values for the transition metals and actinide are smaller than expected based on ionization potentials and covalent radii, so we do not adopt them, but defer to later recommendations based on analysis of a more extensive set of crystal data. Van der Waals radii for the remaining elements through atomic number Z = 93 were taken from Hu et al. [4], who determined them from bond valence parameters (this gives radii usually within 0.1 Å to 0.15 Å of the radii from average atomic volumes in crystals as obtained by statistical analysis of the Cambridge Structural Database [5], but the results show a smoother variation with atomic number). Van der Waals radii for the elements with Z = 94 to 103 were based on the work of Guzei and Wendt [6], who modeled the zero-potential distance for the interaction potentials involved in nonbonded steric interactions; we increased their values by 6%, which is the value they found is needed to make their steric radii scale most consistent with Bondi's van der Waals radii.

Covalent radii are more straightforward, especially for elements that tend to form only single bonds, although some researchers distinguish metallic bonds from covalent bonds. The covalent radii tabulated here are recommendations for single covalent bonds, and they are based on a comprehensive evaluation of experimental data by Cordero et al. [7], who recommended covalent radii for all elements up to Z = 96, and on an analysis combining experimental data and theoretical calculations by Pyykkö and Atsumi [8], who recommended single-bond covalent radii for all elements up to Z = 118. If one is interested in a specific coordination number, oxidation state, or type of ligand, one might find a more appropriate radius in the specialized literature or in the Characteristic Bond Lengths in Free Molecules table in this *Handbook* since the values in the table below are generic average values. In particular, we give the Pyykkö-Atsumi values for carbon and for Z = 97 to 118 and an average of the values from the two sources for all other elements. For Mn, Fe, and Co, Cordero et al. give two values, and we used the lower of these on the average because it corresponds to a smoother periodic trend.

Please note that the van der Waals radii of bromine and lithium have typographical errors in Ref. 3; the correct values (1.85 for Br and 1.82 for Li) in the table below are from Ref. 1.

All values are rounded to the nearest 0.01 Å, but in most cases the uncertainty in the value is of the order of 0.1 Å.

DIPOLE MOMENTS

David R. Lide

These tables give selected values of the electric dipole moment μ for over 800 molecules. When available, values determined by microwave spectroscopy, molecular beam electric resonance, and other high-resolution spectroscopic techniques were selected. Otherwise, the values come from measurements of the dielectric constant in the gas phase or, if these do not exist, in the liquid phase. Entries are listed alphabetically by compound name.

The dipole moment is given in debye units (D). The conversion factor to SI units is $1\ \mathrm{D} = 3.33564 \times 10^{-30}\ \mathrm{C\ m}$.

When the accuracy of a value is explicitly stated, e.g., 1.234(12), where digit(s) in parentheses represent the uncertainty in the last digit(s) of the value, the stated uncertainty generally indicates two standard deviations. When no uncertainty is given, the value may be assumed to be precise to a few units in the last decimal place. However, if more than three decimal places are given, the exact interpretation of the final digits may require analysis of the vibrational averaging. Other information on molecules that have been studied by spectroscopy, such as the components of the dipole moment in the molecular framework and the variation with vibrational state and isotopic species, is given in the references.

Values measured in the gas phase that are questionable because of undetermined error sources are preceded by ≈. Values obtained by liquid phase measurements, which sometimes have large errors because of association effects, are followed by liq.

Table 1 gives dipole moments of individual molecules in the gas or liquid phase. Table 2 lists dipole moments of conformers whose configurations are related by internal rotation around single bonds. These conformers exist long enough to be measured by gas-phase microwave spectroscopic techniques but interconvert too rapidly to be isolated as bulk samples. The conformers are designated as *gauche*, *trans, axial*, etc. The meaning of these terms can be found in the references.

Table 1. Dipole Moments of Gases and Liquids

Name	Mol. form.	μ/D	Ref.
Acenaphthene	$C_{12}H_{10}$	≈0.85	1
Acetaldehyde	C_2H_4O	2.750(6)	3
Acetamide	C_2H_5NO	3.68(3)	5
Acetic acid	$C_2H_4O_2$	1.70(3)	2
Acetic anhydride	$C_4H_6O_3$	≈2.8	1
Acetone	C_3H_6O	2.88(3)	1
Acetonitrile	C_2H_3N	3.92519	5
Acetophenone	C_8H_8O	3.02(6)	1
Acetyl chloride	C_2H_3ClO	2.72(14)	1
Acetylene-carbon dioxide complex	$C_2H_2{\cdot}CO_2$	0.161(1)	22
Acetylene-carbon monoxide complex	$C_2H_2{\cdot}CO$	0.311(1)	32
Acetylene-carbon oxysulfide trimer complex	$C_2H_2{\cdot}C_3O_3S_3$	1.23(2)	53
Acetylene-hydrogen cyanide complex	$C_2H_2{\cdot}CHN$	3.29(3)	32
Acetyl fluoride	C_2H_3FO	2.96(3)	1
Acrylonitrile	C_3H_3N	3.92(7)	5
Allyl alcohol	C_3H_6O	1.60(8)	1
Allylamine	C_3H_7N	≈1.2	1
Aluminum monofluoride	AlF	1.53(15)	1
Ammonia	H_3N	1.4718(2)	5
Aniline	C_6H_7N	1.13(2)	3
Anisole	C_7H_8O	1.38(7)	1
Arsenic(III) chloride	$AsCl_3$	1.59(8)	1
Arsenic(III) fluoride	AsF_3	2.59(5)	1
Arsine	AsH_3	0.217(3)	5
Azulene	$C_{10}H_8$	0.80(2)	1
Barium oxide	BaO	7.954(3)	5
Barium sulfide	BaS	10.86(2)	3
Benzaldehyde	C_7H_6O	3.0 liq	7
Benzeneacetonitrile	C_8H_7N	3.5 liq	7
Benzene-hydrogen sulfide complex	$C_6H_6{\cdot}H_2S$	1.14(2)	40
Benzene-krypton complex	$C_6H_6{\cdot}Kr$	0.136(2)	58
Benzene-sulfur dioxide complex	$C_6H_6{\cdot}O_2S$	2.061(2)	33
Benzenethiol	C_6H_6S	1.23 liq	7
Benzonitrile	C_7H_5N	4.18(8)	1
Benzyl acetate	$C_9H_{10}O_2$	1.22 liq	7
Benzyl alcohol	C_7H_8O	1.71(9)	1
Benzyl benzoate	$C_{14}H_{12}O_2$	2.06 liq	7
Bis(2-aminoethyl)amine	$C_4H_{13}N_3$	1.89 liq	7
Bis(2-chloroethyl) ether	$C_4H_8Cl_2O$	2.58 liq	7
Bis(2-ethylhexyl) phthalate	$C_{24}H_{38}O_4$	2.84 liq	7
Borane carbonyl	CH_3BO	1.698(20)	3
Bromine chloride	BrCl	0.519(4)	3
Bromine dioxide	BrO_2	2.8(1)	18
Bromine fluoride	BrF	1.422(16)	3
Bromine monoxide	BrO	1.76(4)	2
Bromine pentafluoride	BrF_5	1.51(15)	1
Bromoacetylene	C_2HBr	0.22962	5
Bromobenzene	C_6H_5Br	1.70(3)	1
1-Bromobutane	C_4H_9Br	2.08(10)	1
2-Bromobutane, (±)-	C_4H_9Br	2.23(11)	1
1-Bromo-2-chloroethane	C_2H_4BrCl	1.2 liq	7
Bromochlorofluoromethane	CHBrClF	1.5(3)	17
Bromochloromethane	CH_2BrCl	1.66 liq	7
1-Bromodecane	$C_{10}H_{21}Br$	1.93 liq	7
Bromoethane	C_2H_5Br	2.04(2)	5
Bromoethene	C_2H_3Br	1.42(3)	1
Bromofluoroacetylene	C_2BrF	0.448(2)	5
1-Bromoheptane	$C_7H_{15}Br$	2.16(11)	1
Bromomethane	CH_3Br	1.8203(4)	5
2-Bromo-2-methylpropane	C_4H_9Br	2.17 liq	7
1-Bromonaphthalene	$C_{10}H_7Br$	1.55 liq	7
1-Bromopentane	$C_5H_{11}Br$	2.20(11)	1
1-Bromopropane	C_3H_7Br	2.18(11)	1
2-Bromopropane	C_3H_7Br	2.21(11)	1
2-Bromopropene	C_3H_5Br	1.51 liq	7
3-Bromopropene	C_3H_5Br	≈1.9	1
Bromosilane	BrH_3Si	1.319	3
Bromotrifluoromethane	$CBrF_3$	0.65(5)	1
Bromotrifluorosilane	BrF_3Si	0.835(7)	64
1,2-Butadiene	C_4H_6	0.403(2)	1
Butanal	C_4H_8O	2.72(5)	1
1,4-Butanediol	$C_4H_{10}O_2$	2.58 liq	7
1-Butanethiol	$C_4H_{10}S$	1.53 liq	7
Butanoic acid	$C_4H_8O_2$	1.65 liq	7
1-Butanol	$C_4H_{10}O$	1.66(3)	1
2-Butanone	C_4H_8O	2.779(15)	2
trans-2-Butenal	C_4H_6O	3.67(7)	1
cis-2-Butene	C_4H_8	0.253(5)	2
cis-2-Butene-1,4-diol	$C_4H_8O_2$	2.48 liq	7
trans-2-Butene-1,4-diol	$C_4H_8O_2$	2.45 liq	7
trans-2-Butenoic acid	$C_4H_6O_2$	2.13 liq	7
cis-2-Buten-1-ol	C_4H_8O	1.96(3)	5
trans-2-Buten-1-ol	C_4H_8O	1.90(2)	5
1-Buten-3-yne	C_4H_4	0.22(2)	3
2-Butoxyethanol	$C_6H_{14}O_2$	2.08 liq	7
Butyl acetate	$C_6H_{12}O_2$	1.87 liq	7
sec-Butyl acetate	$C_6H_{12}O_2$	1.87 liq	7
Butylamine	$C_4H_{11}N$	≈1.0	1
sec-Butylamine	$C_4H_{11}N$	1.28 liq	7
tert-Butylamine	$C_4H_{11}N$	1.29 liq	7
tert-Butylbenzene	$C_{10}H_{14}$	≈0.83	1
Butyl ethyl ether	$C_6H_{14}O$	1.24 liq	7
Butyl formate	$C_5H_{10}O_2$	2.03 liq	7
Butyl stearate	$C_{22}H_{44}O_2$	1.88 liq	7
Butyl vinyl ether	$C_6H_{12}O$	1.25 liq	7
1-Butyne	C_4H_6	0.782(4)	5
γ-Butyrolactone	$C_4H_6O_2$	4.27(3)	3
Calcium methoxide	CH_3CaO	1.58(8)	43
Calcium monochloride	CaCl	≈3.6	4

Name	Mol. form.	μ/D	Ref.
Camphor, (+)	$C_{10}H_{16}O$	3.1 liq	7
Caprolactam	$C_6H_{11}NO$	3.9 liq	7
Carboimidic difluoride	CHF_2N	1.393(1)	5
Carbon dioxide dimer-water complex	$C_2O_4{\cdot}H_2O$	1.989(2)	23
Carbon dioxide-mercury complex	$CO_2{\cdot}Hg$	0.107(3)	29
Carbon dioxide-water dimer complex	$CO_2{\cdot}H_4O_2$	1.746(10)	28
Carbon disulfide-sulfur dioxide complex	$CO_2{\cdot}O_2S$	1.096(1)	42
Carbon monoselenide	CSe	1.99(4)	3
Carbon monosulfide	CS	1.958(5)	2
Carbon monoxide	CO	0.10980	3
Carbon monoxide dimer-water complex	$C_2O_2{\cdot}H_2O$	1.57(5)	36
Carbon oxyselenide	COSe	0.73(2)	1
Carbon oxysulfide	COS	0.715189	5
Carbon oxysulfide-carbon dioxide dimer complex	$COS{\cdot}C_2O_4$	0.69(5)	44
Carbon oxysulfide-water complex	$COS{\cdot}H_2O$	2.668(3)	37
Carbonyl chloride	CCl_2O	1.17(1)	1
Carbonyl fluoride	CF_2O	0.95(1)	1
Cesium chloride	ClCs	10.387(4)	2
Cesium fluoride	CsF	7.884(1)	2
Cesium sodium	CsNa	4.75(20)	2
Chlorine fluoride	ClF	0.888061	5
Chlorine oxide (ClO)	ClO	1.297(1)	5
Chlorine trifluoride	ClF_3	0.6(1)	1
Chloroacetyl chloride	$C_2H_2Cl_2O$	2.23(11)	1
Chloroacetylene	C_2HCl	0.44408	5
2-Chloroaniline	C_6H_6ClN	1.77 liq	7
